Maregraavia dubia.—This plant, grown in the Edinburgh garden, is well worth a place on a somewhat damp stone wall, from its curious habit of growth. The bracts of the flowers form pitchers, but the plant in this garden has not yet blossomed. The leaves differ entirely when grown against a wall from those which are not so grown. In the latter case they are broadly lance-shaped, about 1 inch wide by 2½ inches long. In the former they are cordate, oval, about ½ inch wide by 1 inch long, lying flat against the wall, so close that at first sight the plant seems to adhere to it by its leaves. This, however, is not the case, as beneath each leaf is a group of adventitious roots adhering tightly to the wall, and though generally hidden by the leaf in some cases they grow several inches long, and remain attached to the wall after the leaves have died. They evidently act as true roots, as some of the long narrow branches become entirely detached from the root of the plant, and grow healthily on the wall. Even on the hottest day the wall beneath each leaf is quite wet, and owing to the moisture quantities of the *Algae Nostoc* and *Pleurococcus* are to be found under the leaves of this specimen. (This is probably a *Boothia*, not *Maregraavia*.) Another specimen—*M. patrica* (of which a small plant is grown at Messrs. Ireland & Thompson's nursery near Edinburgh, as is also a plant of *M. dubia*)—has Begonia-like leaves, much larger than those of *M. dubia*, and adhering closely to their support in the same way. *M. umbellata*, also from Tropical America, is in cultivation, but it is not grown in these Botanic Gardens. *C. M. O.*

New Kinds of Potatoes.—I have read the correspondence on this subject between "A. D." and Mr. Kerr, and in order to convince the former of his error I can state that Adirondack and Queen of the Valley were sent out in 1881 by Messrs. Kerr & Fotheringham, of Dumfries, as I had a supply from them myself that season. If I mistake not they were recommended by a well known Potato grower as varieties suitable for exhibition. This recommendation was surely purely gratuitous, as it appeared in the columns of the *Gardener's Magazine* early in 1881. Acting on the hint I wrote to Messrs. Kerr & Fotheringham to see if they could supply me with them, and had them sent on forth-

with. Both varieties were exhibited by more than two exhibitors at the Crystal Palace, clearly showing that they were in commerce. How has this question arisen at all? Simply because "A.D." was shown in error. Let me add that new Potatoes, or new varieties of anything else, can be offered as well in any part of the kingdom as in London. *An Abyssinian Governor*.

Rhododendrons.—In your issue of the 13th inst. I find mention made of cut blooms of Rhododendron Fortunei exhibited at the Royal Horticultural Society. I may interest you to hear that a large plant of this species, which has stood for many years in my grounds, and which has frequently flowered, is now in splendid bloom, many hundred fine frusses diffusing to a considerable distance a delicious perfume. Rhododendrons barbatum and Thomsoni also flowered beautifully in the open air this spring, and a plant 9 or 10 feet high of Rhododendron Koylei is just about to expand its charming Fuchsia-like flowers. Rhododendron Falconeri forms a small tree, with superb foliage, but has not flowered with me. Plants of Rhododendron Edgworthii and Dalhousiana bloomed well in the open ground for many years, but eventually perished. Chamcerops Fortunei is now finely in bloom. *W. Farrant, Ballmar, Isle of Man.*

Mackaya bella.—There seems to be various opinions about this plant. Referring to pp. 566 and 602, pray what gave rise to the idea that it does not flower here every season? Is it because I have been misunderstood in saying that this season it has not flowered so freely on account of the plant not being now so healthy, and not now having sufficient room, and requires a new situation? I let to say that Mackaya bella has flowered here every season since I took it in flower to South Kensington in 1879 (see vol. xi., p. 629, fig.) I do not consider that root-restriction has anything to do with its free-flowering, or that it should be robbed of its foliage, when I see it flower so freely, planted in a good border in a somewhat warm house, with Cupania, Lagerstromia, and similar plants, which prove more satisfactory in the way than when grown in pots. Many Acanthids of this section are being propagated every two or three years to insure good plants. *Charles Green, Pendell Court.*

Aspidistra lurida variegata.—This is deserving of a much more extended cultivation, as it is one of the most useful plants in existence, growing and flourishing as it does where few others would live, for it may often be seen in the most perfect health in halls and rooms where gas is burned, and where natural light is not often plentiful. I know of one myself that has been in a house for years, compared to the size of a small pot—a 7-inch one—and is the most perfect little specimen I ever met with, as it has thirty-eight beautifully variegated leaves without spot or blemish in any of them. In the Westminster Aquarium, too, it is, or was, holding out bravely, and is about the only thing there in the plant way that does not look wretched. As its powers of endurance are so great, and it is so well adapted for window culture, it is a pity it is not taken in hand by the growers for market, as people residing in towns would then have a plant they could keep, for with anything like fair treatment there is no fear of killing or losing it, as it is so hardy as to be unaffected by frost, and if left so as to become a little pot-bound it will take any quantity of water without suffering harm. The only important part about its management when confined to rooms is the keeping of the leaves clean, which, as they are so large, broad, and leathery, may easily be done by drawing a wet sponge up them occasionally, and if this is attended to they always present a bright polished look, and remain perfectly healthy. Besides being so well adapted for windows or rooms, the Aspidistra lurida variegata is very suitable for greenhouses, or to associate with Ferns, with which its fine foliage contrasts in a pleasing and striking manner, as its Palm-like and bold. Not only will the Aspidistra stand any cold house, but it is hardy enough to bear the winter out, if the crowns are slightly protected. To afford the plants a fair chance, they should be potted early, but they may get well hold of the ground and become established before hard frosts set in. A shady position and light rich soil suits them best, and leaf-mould or cocoa-nut fibre answers well for protection. If an increase of plants be desired, it may be effected readily by division, the best time for doing which is in spring, before they start to grow, as then the injured parts soon heal, and hosts of young roots issue forth. *J. S.*

Mulching for Strawberries.—As a substitute for any of the materials recommended for the above-named purpose on p. 684 of your current issue by your correspondent, "D. C. P.," I would suggest the use of spent Hops from a brewery, which I consider far preferable to any of them, and quite the best top-dressing for the Strawberry at this time of year, as they are much cleaner than stable-litter, any little smell belonging to them soon disappearing after

being exposed for a day or two to the action of the sun and air; slugs also do not like them, and find them difficult to travel over, which is a great additional advantage. The only drawback to their general use is that they are now more difficult to obtain than formerly, as the brewers have discovered that they can be used to supplement coal in their boiler furnaces when thoroughly dried. *W. E. G.*

—The remarks of your correspondent, "D. C. P.," in your last issue (see p. 681), are both reasonable and instructive, but they do not quite include everything that may be done for the preservation and protection of fine fruits. Mulching between the rows of Strawberry plants in winter is familiar practice with a great many, and is quite as beneficial to the plants as your correspondent asserts that it is, but no mulching or surface-dressing that I have ever tried has proved thoroughly successful in preserving the fruits from the ravages of slugs. There is, of course, a great difference in seasons, whether they are wet or dry, as regards the numbers of slugs that attack the Strawberry beds, but at best they are bad enough, and they seem to have a particular relish for the largest fruits. This is both disappointing and annoying, as every one knows. The best and simplest remedy that I have tried as a preservative is to tilt up the plants with forked sticks out of the reach of slugs, or put three or four sticks round a stool and run a piece of rough matting round them for the fruits to hang over. The forked sticks are, however, preferred, and are most expeditious to work with, and this once done the slugs are put to defiance. It is important that the plants be not pressed too close together to prevent the air from passing through them, in which case the fruits would rot in close moist weather. *H. L. C.*

A Garden Trowel.—The illustration (fig. 111) shows, on a reduced scale, a form of trowel exhibited

FIG. 111.—A GARDEN TROWEL.

by Mr. G. F. Wilson before the Scientific Committee. The blade is stout and three-sided, so that it readily penetrates the soil, and serves to divide perennials with facility and with the least possible injury to the plant. For ourselves we should prefer the shank to be slightly curved, not bent at right angles, as shown.

North Borders for Vegetables.—That north borders are quite as useful in the production of crisp sweet vegetables in summer, as south borders are earlier in the season, is a fact which I think is not generally admitted. Somehow or other, north borders are despised. People feel they are chill, cold, and damp, and sometimes even worse things are said of them. But I have gathered juicy sweet Turnips, palatable Cabbages, and fine crisp Radishes, from north borders in the hot dry months of July and August, when similar produce was hardly worth eating from other situations that are looked upon as being more favourable to the development of vegetable crops. No one can foretell whether the coming summer is to be dry or wet, but at least we can use such means as we possess to avoid failure. If the summer turns out a wet one, there will be plenty of vegetables everywhere, but if it should be the reverse, then the produce of the north borders will probably be the best in the garden. *W. Z.*

New Melons.—The correspondence going on between Messrs. Dickson, Brown & Tait and Mr. Carmichael respecting the merits of Best of All Melon is not likely to end satisfactorily to either party unless the line of argument is either modified or changed. Both parties may be right, as no doubt both are sincere; but, as long as "cultivation" is ignored, it is not likely that the disputants can or will agree. Now, it is quite possible—I do not say it is the case—but even so good and experienced a cultivator as Mr. Carmichael (his friends included) may have failed to grow Best of All Melon to perfection, while it is equally possible that Messrs. Dickson, Brown & Tait are relying upon substantial grounds for their statement in respect to quality. Let me give an instance which I think bears upon the case. At the great show held by the Royal Horticultural Society at Preston three or four years ago I exhibited

a fruit of Conqueror of Europe Melon in a very big class, consisting of—as well as I can remember—something over a score of fruits. Mr. Jamieson, gardener to the Earl of Crawford and Dalcarres, of Hlaigh Hall, Wigan, also exhibited a fruit of the same variety, which obtained a 1st or 2d prize, while I did not even get a place. I had my seeds direct from Mr. Jamieson, so there can be no doubt as regards variety; but, strangely enough, Mr. Jamieson's Melon did not bear the outward characteristics of the variety, which I believe he himself raised. It was neither netted, nor anything approaching the size or colour. I have seen Mr. Jamieson exhibit the same variety often enough previously; still, it obtained a prize, while my fruit, which was well coloured and beautifully netted, got nothing, as I believe it deserved nothing. We (Mr. Jamieson and myself) talked the matter over afterwards, and he expressed his surprise at the result, judging of course from outward appearance. But judgment was pronounced by stern competent judges who awarded the prize to "flavour," and here the question points to cultivation, or what is more probable, that the fruits that obtained the prizes were "grown to time" and "up in flavour." I do not attach the importance that many people do to "mere variety." The best kind in cultivation will produce a worthless fruit if badly grown, and now what about the composition of soils and their influence in producing flavour? I have no object in making these remarks, except that I think we might widen the sphere of discussion, and so gain important information. There is no doubt Hero of Lockinge is a splendid Melon, but unless it is grown side by side with Best of All in the same compost and under the same cultural treatment it appears to me that a fair comparison cannot be made. At all events, to praise or condemn upon the evidence before us would be to pronounce judgment upon insufficient facts. *W. Hind.*

White Arums.—In a general way these are kept in pots during the summer, but being plants that require plenty of manure and unlimited quantities of water, they do far best planted out, and when so grown are not half the trouble to look after and make much finer crowns. The best plan in managing them is to prepare a shallow trench after the manner of those for Celery, excepting that it should not be so deep or contain so much manure, which ought to be well decomposed and thoroughly mixed in by digging, when all will be ready for planting. In preparing the plants it is necessary to shake them out of the old soil that they may be divided, which can easily be done by pulling them apart, when the strongest portions should be selected and planted in the trench at about 18 inches apart. A good soaking of water will then be required to settle the earth about them, and to encourage them to start quickly they should be shaded by having a few Laurel or other evergreen branches stuck in along the sides of the row. As soon as the plants get fair hold of the soil the branches may be removed, and it will be a great help to the Arums after that time, which will be slightly mulching of short littery manure, which will shade and keep them cool at the roots, and prevent washing when giving the heavy waterings requisite to maintain them in health. The time for lifting and potting is the end of September or early in October, when they will have made fine growth with short sturdy leaf-stalks and strong crowns: that are sure to send up a number of blooms. The taking up should be done carefully, so as not to injure the roots any more than can be avoided, but as they will have large balls of earth, some of it may be worked out to reduce them sufficiently to go into any sized pots that may be chosen. Light rich soils answers best for the potting, and this should be washed in by heavy watering, when the plants will require the shelter of a deep pit or frame, where they can be kept a little close and shaded for a week or so, to enable them to stand without flagging. Great sprinkling or watering overhead will in a measure prevent this, and will assist the plants materially in forming fresh roots. If any are wanted early in flower, they may be forwarded by subjecting them to gentle heat; but they must be so placed that they can have plenty of air to keep them from drawing, which spoils them for use in a greenhouse. *J. S.*

K. EMPFERIA GILBERTII.

MR. WM. BULL, to whom are due our thanks for the use of the accompanying illustration (fig. 112), describes *Kempferia Gilbertii* as a fleshy-rooted stove perennial, with attractively variegated foliage, introduced from the East Indies. From the succulent roots are annually produced a tuft of oblong-lanceolate deep green leaves, which are slightly undulated at the margin, and bordered by a broad and very conspicuous band of white. The purple and white flowers are peculiar in form, as is the rule in the Zingiberaceae order.

Reports of Societies.

Royal Horticultural: Great Summer Show, May 23, 24, 25.—We regret, in the interests of the Society in particular and of horticulture in general, that we are unable to report this show as a success. As an exhibition of horticultural produce, the display left much to be desired—the show was thin, and somewhat lacking in variety, and several of the leading trade exhibitors were conspicuous by their absence, which we hope must not be taken as an indication of a lack of interest on their part in a Society which they have heretofore so well supported. If under canvas things were not up to the standard of former summer shows, outside, in the garden structure and implement department, the reverse was decidedly the case, the display being both more extensive and of wider general interest than usual.

only two competitors—the old rivals, Messrs. Tudgey and Rann; and the last-named secured the verdict with a grand lot made up of tall specimens of *Areca sapida* and *Pritchardia pacifica*, a magnificent *Cycas revoluta*, very large examples of *Croton interruptus*, *C. Hendersoni*, and *Pandanus Veitchii*. Mr. Tudgey again put up his large *Latania barbonica*, a very fine *Geonoma gracilis*, *Croton Andreanus*, *Cycas circinalis*, and *Cordyline indivisa*. The Fern classes were poorly contested, and brought out but a few of the large and handsome specimens that should have been seen. Mr. Child had the best amateur's six, including an exceedingly fine *Davallia Mooreana*, between 8 and 9 feet over, and a very good *Microlepis hirta cristata*, &c. Mr. Rann was a good 2d, with his large *Gleichenias*, &c.; and Mr. Douglas 3d. The nurserymen's class was a very poor one, the only striking plant being one of *Elechnum brasiliense*, in Mr. H. James' 1st prize lot.

ORCHIDS.—The competing collections of these were, as was the case last year, staged in the long tent leading to the large marquee, and, as on that occasion, gave rise to much heart-burning over some "bedding out" that had only too palpably been indulged in. The best class

has long linear rigid leaves marked with a bronzy central stripe. *Wallochia nana* is a dwarf Palm of striking appearance, with bold pinnate leaves, the segments broad, wedge-shaped; the stalks are covered with reddish fluffy down. *Laurus camphora variegata* is a shrub with widely spreading branches, bearing the foliage in tufts near the extremities. The leaves are oblong-ovate, with a green disc and a deep white margin, which contrasts with the reddish leafstalks. *Sarracenia erythropus* is one of the flava section, with long narrowed trumpet-shaped pitchers, with a large rounded lip supported on a long broad stalk, velvety-red on the inner surface. In popular parlance we heard this striking plant described as a "funny Orchid." *Spiraea aruncus* var. *astilboides* is a very attractive shrubby species, of medium height, with deep green pinnately-divided leaves, and large terminal, many-branched feathery panicles, the spreading branches of which are densely covered with small white flowers. This was the most attractive plant of the group. *Selaginella involvens* var. is a dwarf cup-like species, with black-green foliage tipped with white. *Anthurium digitatum* is a species with long cylindrical petioles, bearing deep green, shining, palmately-lobed

FIG. 112.—*KEMPFERIA GILBERTII*, HORT. BULL. (SEE P. 712.)

STOVE AND GREENHOUSE PLANTS.—The flowering division was well represented by the competing collections in the three leading classes. In the open competition for twelve, Mr. Tudgey, gr. to J. F. G. Williams, Esq., Henwick Grange, Worcester, was well to the front with his large specimens of *Erica Cavendishiana*, *Stephanotis floribunda*, *Fimelea decussata*, *Azalea magnifica*, *Aphelexis macrantha*, *Anthurium scherzerianum*, *Erica ventricosa coccinea minor*, and *Fraxinea confertiflora*, &c. Messrs. B. Peed & Son came in 2d, having a very good *Clerodendron Balfooranum*, *Statice profusa*, *Allamanda grandiflora*, *Exora Williamsii*, *Azalea Roi des Belges*, &c. 3d, Messrs. T. Jackson & Son. The last-named firm came in 1st in the trade class for eight plants, having here in good form *Statice profusa*, *Erica ventricosa coccinea minor*, *Draecophyllum gracile*, *Fimelea amabilis*, *Azalea Criterion*, &c. Messrs. Peed & Son came in 2d, and Mr. H. James 3d, the latter having, among others, a very fine piece of the new *Anthurium Andreanum*. The corresponding class for amateurs found Mr. Tudgey again at the head, his best examples in an unevenly sized group being of *Clerodendron Balfooranum*, *Darwinia tulipifera*, and *Erica Cavendishiana*. Mr. J. Child, who was 2d, with a lot of large plants, had a good *Honganiavillea glabra*, and also a nicely flowered *Azalea Model*, &c. Mr. J. Rann, gr., Handcross Park, was a good 3d.

FINE-FOLIAGED PLANTS.—With these there were

was the open one for fifteen, in which Mr. Child, gr. to Mrs. Fox, was placed 1st, with, amongst others, *Aceris Fieldingi*, *Dendrobum Farmert*, *Masdevallia Harryana*, *Oncidium amplatum majus*, *Saccolabium retusum*, *Masdevallia ignea*, &c. Mr. Douglas and Mr. H. James were placed equal 2d, the best examples from the former being of *Dendrobum nobile*, *Cypripedium villosum*, *Dendrobum Wardianum*, *Calanthe veratrifolia*, and *Odontoglossum citrosimum*; while most conspicuous in Mr. James' group were *Odontoglossum citrosimum*, *O. crispum*, *Cattleya Mendeli*, *Cypripedium niveum*, *Cattleya Mossiae*, and *Oncidium concolor*. For ten, open to amateurs only, Mr. C. G. Salter, gr. to G. Southgate, Esq., Streatham, took the highest award, having good representatives of *Oncidium crispum grandiflorum*, *O. vexillarium*, *Cattleya Mossiae*, *Masdevallia Lindeni* and *M. ignea*, and *Oncidium concolor*. For six, open to nurserymen, Mr. James was 1st, and Messrs. Jackson & Son, Kingston, 2d.

NEW PLANTS.—In the class for New Plants, Mr. Pull was the only exhibitor. His plants consisted of the following—*Drydenbachia regina*, a form with oblong leaves some 8–10 inches long by 4–5 inches in breadth, with a pale yellow disc sprinkled with green blotches, and with a narrow green margin. *D. Rex* has bolder foliage than the foregoing, the leaves being oblong acuminate, 14–16 inches long by 6 inches in breadth, with a green disc marked with white. *Draecna australis variegata*

leaves, cordate at the base, the basal lobes rounded. *Anthurium nitroense* has four-sided leafstalks, bearing large, cordate, oblong, ovate acute leaves, with few and distant nerves. *Illicium religiosum variegatum* is a shrub with oblong ovate, shortly-stalked leaves, with a green disc and a white margin. *Draecna aureolis* is a form with broadly linear leaves, striped longitudinally with green and yellow.

FLORISTS' FLOWERS.—Roses in pots were a conspicuous feature in the large tent, and here Messrs. Paul & Son and Turner fought their prolonged battle over again, and the hat of the judges went to Cheshunt, and yet, all things considered, there was little to choose between the two groups, as Mr. Turner's nine plants were superbly finished and remarkably fresh and even in size. But proportion told in the struggle, and the honours of the day were with Cheshunt. The leading plants in Messrs. Paul & Son's group were a monster *Celine Forester*, fully 7 feet through and 6 feet in height, and laden with fine blossoms; *Centifolia rosea*, very fine; *Charles Lawson*, of enormous size; *La France*, carrying magnificent flowers; *Beauty of Waltham*, *Madame Lacharme*, *Madame Victor Verdier*, *Victor Verdier*, and last, but not least, *Madame Margottin*, a fine Teascented variety that makes a rare pot plant. Mr. C. Turner was 2d with *Edouard Morren*, *John Stuart Hill*, finely coloured; *La France*, *Theresa Lovet*, *Camille Bernardin*, *Sir Garnet Woseley*, a good pot Rose; *Madame*

tion might, perhaps, be taken to the exceedingly large panes of glass employed—those in the house exhibited being some six inches by 20 inches—as dangerous in a wind storm. Their system of fixing the glass by means of zinc caps and clips is apparently most simple, and doubtless effective. Some excellent plant protectors are shown.

Messrs. Johnson Bros. & Co., of Waterloo Place, S.W., exhibit a small curved span section of Peach-house, glazed without putty; also examples of tree-guards, wire and other fencing, of various kinds, all eminently serviceable. The Messrs. E. & E. Hooley, Tooting, Surrey, Beds, have two small span greenhouses, named respectively the Premier and Paragon, of strong build, and well finished; also a good Cucumber box. Messrs. Ward & Deard, of Harlow, Essex, make a show with a carefully constructed boiler for various uses, and it is known as the "Champion," and appears to possess great heating power. They also show their patent upright centrifugal boiler, which needs no setting, garden-seats, &c.

Those eminent greenhouse builders, Messrs. Boulton & Paul, of Norwich, make a fine show with their noble span-roofed greenhouse, 50 by 20 feet, in two compartments, certainly the finest house in the gardens. This plant-house, light, elegant, roomy, well ventilated and admirably fitted, would make a complete separate building for a first-class Botanic Medal in the plant-house class. A second Bronze Medal was also awarded to their admirable span plant frames, all of great strength, and in several cases were fitted with corner iron stands to keep them from the soil. The whole collection is well marked by strength and utility.

Mr. James Matthews, of the Royal Potteries, Weston-super-Mare, comes in next with a truly fine show of his garden art pottery, all fashioned in red terra-cotta ware. There are vases, pedestals, baskets, and things too numerous to particularise, all intended for general use and decoration. Mr. Matthews' fine show deserves him the Silver Medal for garden pottery. Messrs. Dean & Co., of King William Street, London Bridge, took a Silver Medal for their admirable hand-lawn-mowers, and a similar award to Messrs. F. G. Collins & Co., Old Swan Wharf, London Bridge, for their famous "Archedeian" lawn mowers. This firm are also large exhibitors of garden chairs, pumps, engines, and of tools in great variety. The Messrs. Nettelford, of 54, High Holborn, show a remarkably interesting collection of machines, tools, cutlery, and various useful implements. This firm received the award of a Silver Medal in the class for garden tools, and a Bronze Medal for cutlery. The grand stand of ornamental wirework, garden seats, engines, tents, pen supports, flower-stands, and many other most varied and interesting kind, shown by Messrs. J. J. Thomas & Co., of the Edgware Road and Queen Victoria Street, has already been alluded to. It merits all possible praise. In addition to the Gold Medal, the firm also take Silver Medals for wirework, garden seats, and flower-stands; and a special certificate for their large three-side wire plant-stand for bay window or conservatory.

The Coalbrookdale Company shows iron garden-seats and vases in variety, all massive, but painted stone colour, and therefore unattractive. Mr. Henning, 12, Railway Approach, Kenilworth, shows an improved garden netting, and next him come Messrs. Appleby & Co., of Renshaw Works, Chesterfield, who have a large assortment of boilers, valves, garden rollers, and other interesting exhibits, not least amongst which is their useful chain pump for lifting sewage. Their garden hand-pumps are strong and most enduring. The firm get Bronze Medals for hot-water piping, and for garden engines and pumps. Mr. A. E. Wyn, Bishopgate Street, exhibits a miscellaneous assortment of garden seats, and Mr. G. Welsley, Dover Street, Titchfield, have an admirable collection of garden vases and other boilers, and receive a Bronze Medal in the boiler class. Messrs. J. W. Keith & Co. take the Bronze Medal in the class for heating conservatories with their admirable portable hot-water apparatus. The firm also exhibit a large assortment of boilers. Messrs. R. Jenkins & Co., Kotherham, also take a Bronze Medal for large garden rollers. In the class for horse-lawn-mowers, the Messrs. Crowley & Co., Sheffield, receive the Silver Medal, the only award, for their "Invincible," a fine machine—and a similar honour is paid to their hand-machines of the same make. Messrs. Heslop & Son, Southwark Street, S.W., also show a very handsome ornamental fountain in the lobby, get a Bronze Medal for conservatory decorations. Messrs. J. Warner & Sons, of Jewin Crescent, E.C., take the Silver Medal for garden engines, sprayers, &c., and a Bronze Medal is also awarded to Messrs. Arnold & Sons, Weymouth, in the same class. The show of tents made by Mr. B. Edgington, Duke Street, S.E., is a most attractive one, being specially fitted for rough wear, whilst others are almost luxuriously fitted. This exhibitor well merits the Silver Medal awarded. Mr. J. Unite, of Edgware Road, also makes a

big show with this class of garden requisites, and secures worthily the Bronze Medal. The Silver Medal for meteorological instruments—fitly goes to Mr. Joseph Davis, Kennington Park Road, for his fine and varied collection, and in the miscellaneous class Mr. Lipscombe, 44, Queen Victoria Street, gets the Silver Medal for his magnificent collection of the first-class Mall-Leam Edger Company taking the Bronze Medal, and special Certificates are awarded for Wells' spray distributor, and Bertram's chemical fire engines. Similar honours in other classes are given to Mr. Nettelford for a syringe, and Messrs. Edgington for waterproof canvas roofing. The only other award is that of a Bronze Medal made to Mr. R. Holliday, Beaufort Street, Chelsea, for his admirable wirework. Mr. J. Cabot Fox had on the ground his admirable assortment of rustic summer-houses. Mr. J. G. Humphreys, Albert Gate, had an iron shooting-cage, labourers' cottage, tool-house, &c., all of pleasing appearance; Mr. Deveril, of Slough, his useful patent irrigator; and, not least, from Messrs. T. Green & Co., Blackfriars Road—but not in any competition—was a large assortment of fine cement-firm's boilers, lawn-mowers, rollers, garden seats, and other useful requisites.

SCIENTIFIC COMMITTEE.—Sir J. I. Hooker in the chair. *Acacia reticulata* (?)—Dr. Masters showed an acacia which fell on a spot of a Maple received from Mr. Van Volxem under the above name. The plant, however, scarcely corresponds with Boissier's species of this name. The tree is of slender habit, somewhat tender, with spreading branches and palmate leaves, nearly glabrous, three-lobed. The long scarlet bud-scales enveloping the base of the corymbose inflorescence are very attractive at this season. The inner surface of the bud-scales is somewhat velvety, and the rudimentary ovary densely pubescent. The further history of the plant has to be unravelled.

Salt on the Foliole of Trees.—Professor Church, in allusion to the effects of the recent gale, some of the disastrous results of which have been attributed to a deposit of salt on the leaves, recalled his observations made at Cirencester some years since after an autumnal gale, when he had determined the presence, during the crossing of a south-westerly gale, of salt in the rain which fell on the foliage of trees to the extent of 7 grains per gallon, the ordinary amount being only 0.5 grains. The trees in Oakley Park were covered on one occasion with a crystalline deposit on the windward side. In the conversation which ensued several instances of a similar character, and of the deposit of salt on windows at a distance of many miles from the sea, were alluded to. The comparative exemption in some places of Beech trees from the effects of the late gale was mentioned, but this does not appear to have been understood. Mr. J. H. Blackmore exhibited specimens of different varieties of Pears growing side by side at Teddington under the same conditions, the foliage of some of which was greatly injured by the recent gale while others were unaffected. Those leaves which had long foot-stalks, affording long leverage, were, as a rule, more injured than those in which the leaf-stalk was shorter. Vine and Peach leaves were uninjured, so that in these cases the position of the leaf appears to have scarcely had produced the effect, and the differences and unevenness must rather have been due to constitutional variations.

Rhododendron triflorum.—Mr. Mangles showed flowering sprays from the open air of this pretty Sikkim species. The leaves are small, lanceolate, glaucous, and scaly on the under-surface, the flowers being of medium size, and of a flat bell-shaped form. Mr. Mangles mentioned that he had not been successful in crossing the scaly-leaved species with those destitute of scales.

Plants Exhibited.—Mr. Lynch exhibited from the Cambridge Botanic Garden a fine specimen of *Senecio pentalifolius* var. *maritimus*, a remarkably handsome perennial growing wild in Wales, with hoary lobed leaves and trusses of showy yellow flower-heads. Dr. Lowe exhibited a fine specimen of *Cineraria campetris* grown in his garden from seeds obtained from Cambridge, and another specimen from the neighbourhood of Stonehenge. A violet-flowered *Allium*, A. Ostrowskianum, from Turkestan, was also shown by Mr. Lynch. It is one of the most showy of the genus. *Houstonia serpyllifolia* was also shown by Mr. Lynch. It is a tiny trailing plant, with small leaf and beautiful blue flowers, deeper in colour than those of *H. cœrulea*. From Mr. Smece came flowers of Tulips, with petal-like segments developed on the sepals. One of the flowers—a not unfrequent condition. Rev. G. Hemlock remarked with reference to this point that in some of these cases where the unusually placed segment was partly green, partly petaloid, that the inequality of growth caused the flower-stalk to bend over in the direction of least growth, the petalike portion acting as a curb to the more freely growing green portion. To such an extent was this carried that sometimes the flowers were snapped off, this natural process of decapitation giving rise sometimes to unfounded suspicions of mischievous practices.

FLORAL COMMITTEE.—W. R. Kelock, Esq., in the chair. Among the subjects brought before the Floral Committee were some plants of *Lavatera arborea*, with variegated

leaves. They were shown in pots, and were very striking in appearance. Mr. T. Smith, Gloucester, was exhibitor. Mr. Green, gr. to Sir G. MacLery, brought cut spikes of the beautiful *Canna Indiflora* var. *Ehemanni*, the flowers of which are of a remarkable crimson colour. This is a grand plant for a Water Lily tank, as is also *Hydrangea japonica*. To his richly tinted flowers it remains for a long time in blossom. Mr. Stotes showed some beautiful specimens of *Clematis*. Among them were *Star of Surrey*, with very large violet flowers, the petals prolonged into long tails; *C. Violet Cameron*, a large-flowered form with very broad light petals; *C. Forgeroni*, with lilac flowers of medium size; *C. Pandora* with large violet flowers, with narrow pointed segments. Messrs. Heath & Son, of Cheltenham, showed a fine specimen of *Odontoglossum Wilckeanum*, with large cream coloured segments, heavily blotched with brown; the lip is orange-accuminated, fringed and demarcate at the margin. The same exhibitors showed a plant of *Dendrobium formosum* giganteum. Various hybrid (?) forms of *Mimulus* were shown by Mr. Clapham as varieties of *M. moschatus*, such as var. *ruber*, of dwarf habit and bronzy flowers; var. *nanus*, very dwarf, with yellow flowers. Messrs. Paul & Kim, of Chesham, showed sprays of the Golden Nut, *Corylus avellana* var. *aurea*, the rich tints of which are very effective. Messrs. Veitch showed a plant of *Rhododendron aurantiacum* with petaloid stamens, and *Hydrangea japonica* tinged with lavender, with leaves of a yellowish tinge. Messrs. Laing also showed specimens of the richly tinted *Papaver umbrosum*, introduced by Mr. Thompson, of Ipswich. Mr. Churchfield, gr. to H. Littleton, Esq., showed a fine variety of *Anthurium Schzerianum*, with large spathes. Mr. Douglas showed pots of *Veronica Hulkeana*, a greenhouse species of *Veronica*—the long, slender branches of which are densely clothed with pale lilac flowers. This is a species not so well known as it should be. In bloom in an early spring it is one of the most effective decorative plants in No. 1 class. In the hands of winterers would be hardy out-of-doors. Mr. Robert Warner showed a plant of *Odontoglossum crispum* with a fine raceme of very large pale rose flowers with very few spots. The awards made were:—

First-class Certificates.

- To R. Warner, Esq., for *Odontoglossum crispum* giganteum.
- To Mr. Coningsby, for *Masdevallia Veitchii* grandiflora.
- To Mr. Coningsby, for *Oncidium Intellegitur*.
- To Mr. T. Smith, for *Lavatera arborea* variegata.
- To Messrs. Cannell & Sons, for *Pelargonium* (Icy-leaved) *Euryline*.
- To Mr. R. Dean, for *Spergula pilifera* aurea.
- To Messrs. James Veitch & Sons, for *Selaginella platyphylla*.
- To Mr. B. S. Williams, for *Adiantum dolabriforme*.
- To Mr. R. T. Veitch, for *Rose Reine Marie* Heister.
- To Messrs. John Laing & Co., for *Begonia Ball* of Fire.
- To Mr. James Douglas, for *Veronica Hulkeana*.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. Mr. Ward, gr. to the Earl of Radnor, Longford Castle, showed a dozen very fine fruits of *Citrus medica*, which weighed in the aggregate 14½ lb. Mr. Koss, gr. to C. Eyre, Esq., of Wedford Park, Newbury, showed admirably kept specimens of *Cornus Alatica*, *Strawberry*, *Almon*, *Almon*, *White Nonpareil*, *Lord Burghead*, *Baldwin*, and *Stamford Pippin* Apples. Melons were shown by Mr. J. Atkins, Lockinge; Mr. Taylor, gr. to J. McIntosh, Esq., Duncewan, Weybridge; and Mr. C. Howe, Beckenham Park, Newbury; the last named exhibitor showing his seedling scarlet-leaved variety, *Williamstown*, which proved a really good and well-flavoured novelty. Mr. O. Goldsmith, Polesden Lacey, showed two well coloured bunches of the Royal Asot Grape, and a sample of an American variety of Strawberry named Silver Goldsmith. Fruits of the white Becton Pine Strawberry came from Mr. Effic, gr. to W. W. F. Dick, Esq., Thames Ditton. From Messrs. Danics Brothers, Norwich, came a large sample of their *Dufance* Cucumber, a white-spined variety; and of the *Queen of the Pyramids*, a well-cured variety. The awards made were:—

First-class Certificate.

- To Mr. C. Howe, for *Melon William I.*
- Cultural Commendations.
- To Mr. Ward, for *Citrus medica*.
 - To Mr. W. Elphinstone, for *Straw Turkey* Figs.

Crystal Palace : May 29.—The "Grand Flower Show" held on Saturday last, was no more like the really great flower shows that have been held here than chess is like chess. The first extension of the show will require but short notice from us, such exhibitions being all but valueless as aids to horticultural progress. Stove and greenhouse plants were best shown by amateurs—the successful exhibitors being Mr. B. Peed, Mr. W. Gunman, and Mr. C. Mann; while in the trade Mr. Messrs. Peed & Son, and Mr. H. J. James were the only exhibitors who got awards. Messrs. Peed & Son and Mr. B. Peed secured the leading prizes for Heaths, most of the others being witheld; and the trade class for *Andreas* was so poor that only the 3d prize was given. The amateurs class was better, Mr. Child being 1st, and Mr. Katty 2d, the 3d being witheld. Mr. Katty was 1st for six, and Mr. Turner 1st for eighteen, the latter being very good. Fine-foliage plants were very good, Mr. Rann being 1st, and Mr. Penfold, Beddington House, 2d. Of Orchids there were only two collections, from

Mr. H. James and Mr. Salter, fr. to J. Southgate, Esq., Mr. Penfold and Mr. James were well to the front with Ferns, and Mr. Bird, jr. to J. A. Causton, Esq., Alven Park, West Dulwich, took the lead with Crotons, with a vigorously grown and well developed lot of plants. For twelve Clematises Messrs. Jackson & Son were 1st, and Messrs. R. Smith & Co., Worcester, 2d, both showing remarkably well. The Roses and Pelargoniums from Mr. Turner were the best in their classes, and Messrs. Laing & Co. took a 1st prize for a group of plants arranged for effect in one of Messrs. Edgington's tents, and which in the evening, when lighted up by gas and Main's standard electric light had a very pleasing effect. The miscellaneous groups included a choice collection of small alpine and other hardy plants from Messrs. James Carter & Co., cut flowers of Pyrethrums from Messrs. Keilway & Son, Langport; and of Pelargoniums, double Fuchsias, &c., from Messrs. Cannell & Sons, Swainby; Pansies, &c., from Mr. Hooper, Bath; and Pansies from Messrs. Hooper & Co., Covent Garden.

Edinburgh Botanical: May 11.—Professor Isaac Balfour, President, in the chair. In the motion of Professor Dickson, seconded by the President, the Society unanimously adopted a recommendation of the Council to re-establish the Society's triennial prize of £10 in connection with the University of Edinburgh, to be awarded for the best original botanical research, competitors to have been previously selected by the award, attended the Botanical class. Emeritus Professor Balfour contributed a "Notice on the Death of Charles Robert Darwin, Honorary Fellow" of the Society.

II. In a communication "On the Germination of Streptocarpus caulescens lately raised by the Edinburgh Botanic Garden from seeds sent home by Mr. Buchanan, Blantyre, Central Africa," Professor Dickson referred to the facts already known regarding the germination of such species as Streptocarpus Rhexi and S. polyanthus, from South Africa, where the two cotyledons are at first very small and of equal size, one of them being stationary in development and finally disappears while the other continues to grow, forming an elongated sessile leaf of considerable size lying flat along the surface of the ground. In these species the enlarged cotyledon persists throughout the life of the plant, and is the only leaf-organ performing proper leaf-functions, the other leaves being developed merely as bracts in connection with the inflorescence. A similar development, it can hardly be doubted, occurs in Acanthocheilus strigosum, described by Sir J. D. Hooker in the Botanical Beecheyana, vol. 1, p. 359, a plant belonging to the same natural order (Gesneriaceæ), and also native of South Africa. It is noteworthy that in yet another South African plant, of very different affinities—the celebrated Welwitschia—we have also an instance of leaves, either the cotyledons, or, as seems probable (certainly from Mr. Power's researches) the two first leaves of the plumbe, becoming much enlarged, persisting throughout the lifetime of the plant, and performing exclusively, in absence of any other foliage-leaves, the ordinary leaf function, just like the enlarged cotyledon of Streptocarpus polyanthus. In the Blantyre Streptocarpus the plant germinates at first with two minute cotyledons of equal size and opposite to each other—i.e., at the same level. A little later, however, one of these is observed to become larger, the other remaining stationary. The larger cotyledon goes on growing, developing a distinct petiole, and ultimately forms a leaf differing in no essential respect from the foliage leaves succeeding it on the stem of this caulescent species. A further peculiarity is that the cotyledons thus unequally developed, though at first opposite each other, become, in time, separated, and separated by an internode, the larger cotyledon being carried up nearly half an inch higher than the smaller one—a very remarkable phenomenon in a dicotyledonous plant. S. caulescens has all the appearance of being an annual, the root being feebly developed. The larger cotyledon, moreover, is evidently of no greater permanence than the foliage leaves which succeed it, and which, as already said, it closely resembles. In the axils of both the cotyledons and of the foliage leaves buds are developed; in the first place a primary axillary bud, and then a little more an accession of lateral buds below the level of the bud, between it and the leaf-base. It might be a question for evolutionists whether to regard the condition of S. caulescens as a step towards the highly differentiated one of S. polyanthus, or as a step towards reversion to a more normal development; a speculation, perhaps, scarcely worth entering upon.

III. The President communicated a "Report on the Vegetation in the Garden of the Royal Botanic Institution, Glasgow, for January, February, March, and April, 1882," by Robert Bullen, Curator. On the 1st of January the thermometer was at the freezing-point on four occasions, and below it only twice—the lowest temperature registered being during the nights of the 8th and 20th, when 3° and 2° below 0° of frost were recorded; the highest temperature at noon on the 6th, with a little sun. The vegetation was usually forward, but of many hardy shrubs, especially of the tall ones of the harder Lonicera having young growth 2 or 3 inches in length. During February the thermometer was below the freezing-point on six occasions, the lowest reading being on the 15th, when 3° of frost were recorded, the highest at 11° on the 27th, and the total of frost for the month being 7°, and one at the freezing-point, but this had no retarding effect on the vegetation, already noticed as being wonderfully forward. Petasites vulgaris was in full bloom the first week in the month; Digitalis purpurea, Sisyryrhium, and Scilla taliea and striata; by the month, the buds of the sanguineum was noticed in bloom on the 26th on the banks of the River Kelvin, Pulmonaria officinalis and Hepatica

triloba were in bloom at the end of the month. The buds on Poplar, as well as on some of the Lonicerae were in full leaf. During the month of March, the thermometer was at or below the freezing-point on four occasions, the lowest reading being during the night of the 27th, falling to 2°; or 4° of frost; cold winds with occasional hailstorms were, however, the cause of low temperature than actual frost—the total of frost for the month being 8°. Vegetation made little progress, and the plants previously noticed as in premature bloom received a check. In April the thermometer was at the freezing point on four occasions, and below only twice, on the 6th and 15th, when 3° and 6° of frost were recorded, the total of frost for the month being 9°. During the earlier part of the month vegetation made little progress, owing to the cold winds which prevailed. The leaves of the more tender herbaceous plants, as also those of several deciduous trees and shrubs, were slightly injured by the frost on the night of the 15th inst. No frost having been experienced since that date, no ill effects are observable. The leafage of most trees is at least three weeks in advance of the last two seasons.

IV. Report on Temperatures and Vegetation at the Royal Botanic Garden, Edinburgh." By Mr. Sadler. During the month of April the thermometer was at or below the freezing point on six occasions, as compared with twenty-one in the same month last year. The lowest temperatures were on the 6th, 10th, 15th, 18th, 20th, 27; 12th, 29; 13th, 31°; 16th, 26°; 27th, 28°. Since May commenced, although the thermometer has not fallen to the freezing point, yet the night temperatures have been very low, as shown by the following readings:—1st, 34°; 2d, 39°; 3d, 33°; 4th, 34°; 5th, 37th, 29°; 6th, 25°; 7th, 29°; 8th, 29°; 9th, 26°. On the 23rd, 25th, and 11th the thermometer registered 43°. These low temperatures, along with the east and north-east winds, retarded vegetation very much, and it is only by the last two genial days that it has made a fresh start. The frosts of April, owing to the advanced condition of vegetation, did much injury to fruit trees, and bushes in flower, as well as to tender shrubs, in many parts of the county.

During the month of April 21 species and varieties of plants came into flower on the rock garden, as compared with fifty-two in April last year. During this season there have already come into flower on the rock garden 346 species and varieties, as compared with 158 at this date last year.

V. Miscellaneous communications.—1. Mr. Isaac Anderson-Henry, of Hay Lodge, Trinity, placed on the table two plants in bloom, which he conceived to be wholly new to this country. The one, an Androsace, had been grown from seeds labelled Olearia ilicifolia, sent by Dr. Carl, of Wellington, New Zealand, as collected on Mount Ruahine Heds, in the Northern Island. The plant on the table was the only seed which came up of the contents of the packet. In New Zealand, Samolus is the only known representative of the Primrose order, yet, if got on these high summits, not at all botanically explored, it may have been mingled with seeds of Olearia. Sir Joseph Hooker maintains that these mountain ranges will yet yield a rich harvest to the explorer. The other plant, an Arnebia, was raised from seeds sent by Mrs. Augustus Johnstone, and picked up in elevated valleys between Murre and Rawul Firdi; they were labelled "Prophet Flower." It may be Dr. Johnson's A. species.

2. The following plants in bloom, from the Royal Botanic Garden, amongst others, were placed on the table, presented by Mr. W. E. Dixon:—Acanthopulchella, Meconopsis simpliciifolia, Anhyllis emacea, Andromeda fastigata, Gentiana verna, Primula sikimensis, P. mollis, P. auriculata, P. capitata, Androsace rotundifolia var. macrocalyx, Penstemon Menziesii, Anemone triphyllum, Saxifraga calyciflora, S. Mac-Nabiana, S. Caryana, Lithospermum oleifolium, Ranunculus parnassifolius, Fuchsia cordata, Aetnaria grandiflora.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 24, 1882.

MONTH AND DAY.	BAROMETER.	TEMPERATURE OF THE AIR.			HYGROMETRIC DEGREES FROM THE POINT OF SATURATION.	WIND.

- May 18.—A very fine bright day, sunny, brightly blue sky. Fine clear cold night.
- 19.—A very fine bright day, dark clouds passing at times. Very dark sky, appearance of rain at night.
- 20.—A fine bright day, sun shining brightly. Fine clear night.
- 21.—A very fine bright day, sun shining, brightly overcast at times. Thin rain at night.
- 22.—A fine day, but overcast at intervals. Fine night.
- 23.—A fine day, overcast, hail and rain from 2 P.M. to 2.30 P.M. Afterwards fine and bright. Fine fine night.

LONDON: Atmospheric Pressure.—During the week ending May 20 the reading of the barometer at the level of the sea increased from 30.34 inches at the beginning of the week to 30.35 inches by 9 A.M. on the 13th, decreased to 30.29 inches by 3 P.M. on the 14th, increased to 30.33 inches by 9 A.M. on the 15th, decreased to 30.25 inches by 3 P.M. on the same day, increased to 30.49 inches by 9 A.M. on the 17th, and was 29.87 inches at the end of the week.

The mean reading for the week at the level of the sea was 30.25 inches, being the same as last week, and 0.34 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 68°, on the 18th. On the 15th the highest temperature was 56°. The mean of the seven highest temperatures was 63°.7.

The lowest temperature in the shade in the week was 38°, on the 17th; on the 20th the lowest temperature was 46°. The mean of the seven lowest temperatures was 47°.3.

The greatest range of temperature in any day was 28°.5; on the 18th; the smallest was 14°.7, on the 15th. The mean of the seven daily ranges was 22°.

The mean temperatures were, on the 14th, 50°.7; on the 15th, 47°.3; on the 16th, 48°.8; on the 17th, 49°.6; on the 18th, 53°.2; on the 19th, 54°.1; and on the 20th, 54°.6; of these those of the 19th and 20th were above their averages by 0°.4 and 0°.9 respectively; the rest were below their averages by 0°.6, 4°.6, 3°.5, 3°.2, and 1°.2 respectively.

The mean temperature of the air for the week was 51°, being 2°.3 lower than last week, and 1°.7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the rays of the sun, was 149°.5, on the 19th; the highest, on the 15th, was 125°. The mean of the seven readings was 140°.6.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 34°, on the 16th and 18th. The mean of the seven readings was 36°.4.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending May 20 the highest temperatures were 71°.8 at Nottingham, 70°.5 at Leeds, and 58°.7 at Bradford. The highest temperature at Brighton and Hull was 62°, and at Plymouth was 63°.5; the general mean was 67°.

The lowest temperatures in the week were 32° at Cambridge, 33°.5 at Sheffield, and 34° at Wolverhampton and Hull. The lowest temperature at Brighton was 39°.6, at Plymouth 38°.5, and at Blackheath and Liverpool was 38°. The general mean was 35°.6.

The greatest ranges of temperature in the week were 35°.9 at Nottingham, 36° at Cambridge, and 35°.4 at Wolverhampton. The least ranges were 22°.4 at Brighton, 25° at Plymouth, and 28° at Hull. The general mean was 31°.4.

The mean of the seven high day temperatures was highest at Nottingham, 65°.6, at Blackheath 63°.3, and at Sunderland 63°.1; and was lowest at Hull, 56°.6, at Brighton 58°.6, and at Sheffield 59°. The general mean was 61°.4.

The mean of the seven lowest night temperatures was highest at Liverpool, 41°.0, at Truro 41°.9; and at Plymouth 41°.4 and was lowest at Cambridge, 35°.1, at Bristol 37°.3, and at Hull 37°.4. The general mean was 39°.5.

The mean daily range was greatest at Cambridge, 28°.0, at Nottingham 26°.6, and at Wolverhampton 24°.8; and was least at Brighton, 17°.4, at Liverpool 18°.1, and at Plymouth 19°.1. The general mean was 21°.9.

The mean temperature for the week was highest at Blackheath, 61°.0, and at Truro and Nottingham 56°.6; and was lowest at Hull, 45°.3, at Sheffield, 46°.8, and at Bristol 47°.4. The general mean was 48°.8.

Rain.—The falls were 0.05 inch at Truro, 0.04 inch at Brighton, 0.03 inch at Sunderland. No rain fell at Plymouth, Bristol, Blackheath, Leicester, Cambridge, Wolverhampton, Nottingham, Sheffield, Liverpool, Bolton, Hull, Bradford, or Leeds. The general mean fall was 0.01 inch.

SCOTLAND: Temperature.—During the week ending May 20 the highest temperature was 76°.5, at Paisley; at Edinburgh the highest temperature was 60°.4. The general mean was 67°.4.

THE
"INVINCIBLE" LAWN MOWER
 (SAMUEL EDWARDS' PATENT),
 AWARDED
THE ONLY GOLD MEDAL
Ever offered in England for Open Competition.

LATEST AWARDS.

Royal Horticultural Show, The Gardens, South Kensington, London, May 23 to 25, 1882.

FIRST PRIZE SILVER MEDAL (for Horse-Power).

FIRST PRIZE SILVER MEDAL (for Hand-Power).

FIRST PRIZE (Society's Medal) International Horticultural Show, Botanical Gardens, Manchester, August, 1881, in competition with the leading makers, both English and American.

Send for Illustrated Price List to Sole Makers,

JOHN CROWLEY & CO., Sheffield.

(REGISTERED)

Hydro-Carbon Oils as Insecticides and Washes for Plants and Animals.

**SOLUBLE
 FIR TREE OIL INSECTICIDE.**
 Bottles, 12. 6d., 25. 6d., 45. 6d., and 75. 6d.;
 Gallons, 12s. 6d.; Cases, 11s. per gallon.

It destroys all insect pests on plants and fruit trees, whether at the roots or on the foliage. It destroys all parasites and fungoids which infect animals and human beings.
 It is free from poison, very clean and pleasant in the using.
 It is the cheapest insecticide ever produced.

(Testimonial.)

Willersley Gardens, February 15, 1882.
 Mr. HUGHES.—Sir,—Please send me at once a gallon of Fir Tree Oil. I have again tried the above, and believe it to be what has been said of it. My previous disappointment with it was on account of its not being stured sufficiently.—Yours, &c.,
 JAS. TISSINGTON.

From all Seedsmen and Chemists. Manufactured by
 E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.

GISHURST COMPOUND.—Used by many of the leading Gardeners, since 1859, against Red-spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 oz. to the gallon of soft water, and of from 1 to 15 oz. as a winter dressing for Vines and Fruit Trees. Has outwitted many preparations intended to supersede it. In Boxes, 12, 3s., and 10s. 6d.

AMERICAN BLIGHT ON APPLE TREES
 CURED by rubbing a wet hard Painter's brush on Gishurst Compound, and working the latter into the infected part.

GISHURSTINE keeps feet dry, softens hard boots, preserves leather, takes a polish. In boxes, 6d. and 12. each.

Wholesale by **MRS'S PATENT CANDLE COMPANY** (Limited). Retail by Seedsmen and Oilmen.

ELLIOTT'S IMPROVED

"SUMMER CLOUD" SHADING,

FOR

GREENHOUSES, CONSERVATORIES, SKYLIGHTS and all GLASS STRUCTURES that require Shading Material.

It combines Efficiency with Appearance, Convenience with Economy, and its effects are Lasting.
 Sold in Packets, 12. each, with full Directions for Use, and may be obtained from all Seedsmen and Nurserymen.

Sole Manufacturers and Proprietors,

CORRY, SOFER, FOWLER & COMPANY (Limited), FINSBURY STREET, E.C., and London, SHAD THAMES, S.E.

TANNED NETTING, from 1 yard to 4 yards wide, 1d. per square yard, subject to a liberal discount on large quantities.
SHADING CANVAS, from 3 1/2 ft. per yard, and upwards.
BEST ROLL TOBACCO PAPER, RAFFIA FIBRE, RUSSIA MATS.
SACKS and BAGS, New and Second-hand. **ROPES, LINES, and TWINES**. Descriptive Catalogue post-free on application.

 HORIZONTAL BOILER**
 Unequalled for Simplicity, Power, and Economy.

See *Gardener's Chronicle*, Jan 1880, and Nov. 19, 1881.

As inferior imitations of this now well-known Boiler are being advertised and sold to the detriment of its reputation, C. P. R. & Co. have in conjunction with *Gardener's* and the *Iron*, generally list Mr. Rochford has assigned to them the sole and exclusive right for its Sale and Manufacture.

HOT WATER PIPES and BOILERS

From our large and complete stock at wholesale prices.
CHARLES P. KINNELL & CO.,
 IRONFOUNDERS, 31, BANKSIDE, LONDON, S.E.

HOSE—HOSE—HOSE.

PATENT RED-RUBBER GARDEN HOSE.

Stands severe tests of Government Departments, thus proving superiority of quality. Lasts four times as long as ordinary India-rubber Hose, Lighter in Weight, Greater in Strength, and Cheaper in the long run than any other Hose for Garden Use.

A correspondent writes:—"I have had a length of your Red-Rubber Hose in use nine years, and it is now as good as ever."

Private Customers Supplied at Trade Prices.

"Gather Honey from Your Flowers."
NEIGHBOURS' Celebrated BEEHIVES, for taking Honey without the destruction of the Bees.

PHILADELPHIA EXHIBITION, 1876.
 PARIS EXHIBITION, 1878.
 Three Silver Prize Medals awarded to Geo. Neighbour & Sons. Also the First Silver Cup at the Caledonian Apiarian Society's Show at Edinburgh, 1877 (in connection with the Highland and Agricultural Society's Annual Exhibition), for the largest and best display of Bees, Bee-Hives, and Bee Apparatus.

NEIGHBOURS' IMPROVED COTTAGE BEE-HIVE

as originally introduced by Geo. Neighbour & Sons, working three bell-glasses, is neatly and strongly made of straw; it has three windows in the lower Hive.

This Hive will be found to possess many practical advantages, and is easy of management than any other Beehive that has been introduced.

Price, complete £1 15 0
 Stand for ditto 0 10 0

PHILADELPHIA PAR-FRAME HIVE, from which the Combs can be removed at side opening whilst supers are on. This Hive affords remarkable facility for manipulation, because the frames can also be taken out from top as with other Frame

Hives, and at the same time afford great opportunity for full inspection, having glass on three sides closed with shutters.
 Price, complete, with Cover and Stand, 42s.; also Par-Frame Hives, of most approved construction, at 7s. 6d., 12s. 6d., to 15s. each.

An **ITALIAN ALP QUEEN**, with full directions for uniting to Black Stocks, at current prices.

LIGURIAN and ENGLISH BEES.—Stocks and Swarms may be had at heretofore.

"THE APRIARY." By ALFRED NEIGHBOUR. 5s. postage 5d.

A newly-arranged Catalogue of other Improved Hives and Appliances, with Drawings and Prices, sent on receipt of two stamps.

Can be obtained in all sizes and qualities of
BETHAM & SON,
9, LOWER THAMES STREET, LONDON, E.C.
B. & Son have always a large stock in London of 20-in. by
12-in., 20-in. by 14-in., 20-in. by 16-in., 20-in. by 18-in., 16-oz.
and 21-oz.; and also large sizes in all qualities for cutting-pur-
poses, in 200-ft. and 300-ft. cases.

KEITH'S PATENT HOT-WATER BOILERS.

Can be heightened or lowered, or made to suit any requirements. They stand complete in themselves, and require no building work, being wholly water-jacketed and thus entirely free from risk by fire. They can be had all sizes, to heat from, say, a few feet, up to 8000 feet of 4-inch pipe each; are now in all parts of the world, and are unrivalled as being the best, most powerful, and most economical Hot-water Boilers in use.

Specimen Extracts from Testimonials,
From W. MORGAN ROBERTS, Esq., Architect, Uffcrossed,
September 9, 1881.
"I am delighted with your Boiler; it answers admirably, and the directors are satisfied that it is one of the best I've worth ever put in the hotel."
From Q. C. CHALMERS, Gardens of James Madie, Esq.,
Broughty Ferry, September 15, 1883.
"Your Boiler beats all my expectations, at present one fire serves for twelve hours, and keeps up a good, steady heat."
From ISAAC HOLDEN, Esq., Oakworth House, Keighley, York-
shire, June 10, 1881.
"Your Boilers are the best we have tried." (Note: one of these Boilers heats nearly 8000 feet of 4-inch pipe.)
From WM. FRASER, Kippes Gardens, Dinwiddie, Perthshire,
December 6, 1881.
"I consider your Boiler most efficient; as for economy, it is the acme of perfection."
From Rev. James CARDBELL, Military Academy, Highlands,
Perth, December 31, 1881.
"Nothing could be better than the Boiler you sent me; it burns all sorts of rubbish, and gives an excellent heat."
From ARTHUR BOOTY, Esq., Rose Villa Nurseries, High Harrogate, March 22, 1882.
"Your Boiler has exceeded all my expectations; it will pay for itself as a fuel saver in a short time. It heats 2000 feet of 4-inch pipe."
Keith's Treatise on "Heating by Artificial Means," post-free for twelve stamps.

Roofing Tiles of great variety, Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and RICK BURRS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities. F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

THE "AUTOMATON."

THOUSANDS IN USE.
SENT CARRIAGE PAID.
MONTH'S TRIAL ALLOWED.
NO CHARGE FOR PACKING.

THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and *Gardener's* use. They cut the grass perfectly, leave no ribs, but produce a smooth velvety surface on the lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is unnecessary to roll the grass in front of the cutters. They have the best machine made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

R. H. & J. also manufacture "REVERSIBLE" Lawn Mowers for small Gardens and Borders, and "HORSE-POWER" Lawn Mowers for Large Lawns, &c.

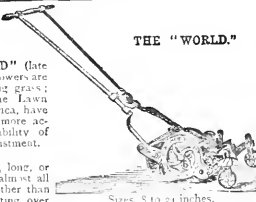

RANSOMES' LAWN MOWERS ARE THE BEST.

MELBOURNE EXHIBITION, 1881. THE HIGHEST AWARD. COMPLETE PRICE LISTS FREE BY POST.

STOCK KEPT IN LONDON at Arch 92, Spitalfields Station, Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies,
ORWELL WORKS, IPSWICH.

THE "WORLD."

The "WORLD" (late "GLOBE"), Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate facing and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "bents." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

Sizes, 8 to 22 inches.
FOR CUTTING LONG GRASS.

VIRGIN CORKWOOD,
for Ferneries, Rockeries, and Ornamental Work in Gardens, supplied at wholesale rates to Nurserymen and Seedsmen by
WM. RANKIN and SONS, 10, Carlton Place, Glasgow, and Lisbon, Portugal.
Shipments direct from Lisbon at special quotations.

PAINT.—Large quantity for Sale, especially prepared for Horticultural Buildings, Greenhouses, &c., 2 1/2d. per lb.—all colours. Improved Zinc White Paint, 4 1/2d. per lb. Cash.—A. LEE & CO., 225, London Road, Southwark, E.

HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully as durable, and it was introduced upwards of thirty years ago by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 35 gallons each, at 12. 6d. per gallon at the Manufacturer, or 12. 5d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Pierrefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chesham to your address, a lib's worth of cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chesham.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which it is not genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates &c., sent free on application to
HILL and SMITH, Briery Hill Ironworks, Staffordshire; 18, Queen Victoria Street, London, E.C.; and 150, Buchanan Street, Glasgow.

ADIE'S PATENT LAWN EDGER.

THIS Machine constantly employed will pay itself in two days. Dr. Hoag, in the *Journal of Horticulture*, says—"This Edger Clipper we have used, and know not which to admire most—its simplicity or efficiency." Mr. More, in the *Florist*—"This new machine does its work rapidly and admirably, the grass being cut with precision, and," he further adds, "the use of it will, we have no doubt, become general." Price 30s.

PALL MALL LAWN EDGER CO., 15, Pall Mall, London, W.

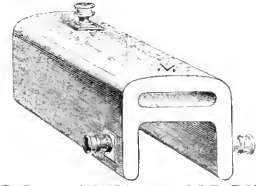

2-WHEEL HAND GAPPING DRILLS.
Will save every description of Farm and Garden Seeds.

There is no spring and slide to get out of order and damage the seed, being worked by a brush. The rows can also be put at equal distances without a line.
Price, with 2 wheels, 20s. each, with 1 wheel, 16s. each, to sow 2 rows, 12s. 6d. each.

For larger Manual and Pony Drills, see Illustrated List free from **F. BIRD & CO.,** 11, Great Castle St., Regent St., London, W.

EPPS'S COCOA. "A thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast system, is perfectly harmonized with the stomach, affording a beverage which may save us many heavy doctor's bills. It is the judicious and safe remedy for all those numerous and sad affections which arise directly or indirectly from a disordered constitution, may be gradually built up until strong enough to resist every tempest of disease. It is the most beneficial of food, and affords a healthy basis for the system. It is the most reliable of remedies for all those ailments which arise from a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette. Made simply with boiling water or milk. Sold only in packets, labelled. JAMES EPPS and CO., HOMOEPATHIC CHEMISTS, London. Makers of Epps's Chocolate Essence for Afternoon use. HOLLOWAY'S PILLS.—In general debility, nervous excitation, and mental depression, these universal Pills have a marvellous effect, they have won the confidence of millions in all parts of the civilized world. Constitutions shaken by sensual excesses, by long residence in unwholesome climates, by sedentary habits, overwork, worry, or anxiety, are wonderfully renovated by a course of this extraordinary medicine, which, powerful as it is its action on the whole system, is perfectly harmless. The most sceptical cannot be composed of rare and carefully selected balsams, without the admixture of any mineral, vegetable, or other deleterious substance. They operate gently, powerfully, and beneficially upon the whole mass of blood, the most sceptical cannot question the fact when we see indigested curd, liver complaints assayed, the oppressed lungs brought into healthful play, and every physical function renewed and strengthened by their agency.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions. His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. See "Journal of Horticulture," of June 9, 1881.—MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them.

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1856, And Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

Single-handed Lawn Mower.

To cut 6 inches	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches	2 10 0
Can be worked by a Lady.	
To cut 10 inches	3 10 0
Can be worked by a strong Youth.	
To cut 12 inches	4 10 0
Can be worked by a Man.	
To cut 14 inches	5 10 0
Can be worked by a Man.	

Double-handed Lawn Mower.

To cut 16 inches	Price £6 10 0
This can be worked by One Man on an even lawn.	
To cut 18 inches	7 10 0
By a Man and Boy.	
To cut 20 inches	8 0 0
By a Man and Boy.	
* To cut 22 inches. By Two Men ...	8 10 0
* To cut 24 inches. By Two Men ...	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 36 inches	£22 0 0
To cut 38 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

PRICES.

Without Grassbox.

To cut 6 in. £1 1 0
To cut 7 in. 1 8 0
To cut 8 in. 1 15 0

This Mower is specially designed to meet an almost universal want experienced by those who have small lawns or grass plots, to have a good and useful machine at a low price. The inventor having seen this want continually increasing, year by year, has brought out the Mower to meet the requirements of the public by supplying a good and useful machine at a cheap rate.

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c.; it is a most handy, serviceable machine, and very easy to work.

PRICES.

With Grassbox.

To cut 6 in. £1 5 0
To cut 7 in. 1 13 0
To cut 8 in. 2 0 0

GREEN'S PATENT GRASS EDGE CLIPPER.

Specially designed to cut the overhanging grass on the edges of walks, borders, flower beds, &c., and to do away with the tedious operation of cutting with shears.

SIZE and PRICE.

Wide.	Diam.
8 in.	7 in. £1 10
Packing Case, 2s.	

GREEN'S PATENT LAWN TENNIS COURT MARKER.

This Machine is of novel design and construction, and the simplest and most effective in its operations.

In the trough containing the liquid there is a loose drum which revolves when the machine is in motion, and conveys the marking material to the intermediate pulley, which in its turn transmits it to the front one, so that the ground is marked effectively as the machine is pushed along.

Price, 21s.

Small Bag of Patent Marking Composition, Mat, and Packing, 1s. 6d.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention,

Garden Seats and Chairs, and Horticultural Implements of every description, Wire Netting, &c., &c.

Descriptive Illustrated Price Lists free on application to

THOMAS GREEN & SON (Limited), Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London.

MANSON HOUSE, LONDON. A Grand Rose Show

WILL BE HELD AT THE MANSSION HOUSE, 108, FRIDAY, JUNE 30, 1882, IN AID OF THE FUNDS OF THE ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO BRIDGE ROAD, AND THE Convalescent Home for Scarlet Fever Patients.

The Exhibition, which will be arranged by Mr. J. Forsyth Johnson, Horticultural Director of the Alexandra Palace, will consist of 10,000 first-class gardens of the principal growers, arranged with Ferns and other accessories in an artistic manner, and of a Competition confined to Amateur Growers.

All Roses to be grown by Exhibitor, and exhibited in boxes to be shown as cut from the trees. Any buds and leaves may be left, but no loose leaves to be added. Added foliage will disqualify. All the exhibited Roses, unless reserved, will be sold at fixed price, and delivered at the close of the Show, at 7 P.M. All exhibitors to be ready for judging by 10.30, or they will not be eligible for competition. Entries to be made on or before June 27, addressed to the Secretary, Mansion House.

 Sample dozen post-free, others package free. Cash with all orders.
T. FLETCHER AND SON, Florists, &c., Chesterfield.

Novelty.
GRAND NEW BEDDING PLANT.
LOBELIA "ANDREW HOLMES"—
 This splendid variety is now offered at the best value extant. It is possessed of a hardy growth, compact, cushion-like habit, and excessive floriferousness, combined with the intense deep blue color that marks the well-known variety "Blue" remarkably having, at the same time, a small well-defined white eye, being brighter and of much evener growth than that variety, and lacking its tenderness. Conspicuously recommended by the exhibitor, who is now distributing it, as superior to every kind cultivated.
 The following testimonials are from Mr. J. FIELDEN, Head Gardener to the York and Airedale Railway Society:—
 "The Museum Gardens, York, May 23, 1882.
 "LOBELIA ANDREW HOLMES I consider in the fore-front of the many really good Lobelias now before the public. It has a good compact habit, very floriferous, and its color, so unlike Gentiana vera, one of our loveliest alpine plants, and most soon become a popular favorite."
 "J. FIELDEN, York." Price 12s. each, 9s. per dozen, 60s. per 100.
 The usual discount to the Trade.
GEORGE HOLMES, Florist, York.

CHEAP BEDDING
 and OTHER PLANTS.
GERANIUMS, from single pots, **Scarlet**, **Pink**, **&c.**, *2s.* per dozen, *10s.* per 100.

GRASS SEEDS

FOR LAWNS,
Of the finest close growing Evergreen kinds, 2s. per lb. Special
preparations for all purposes, soils and situations. Advice gratis.

Unsolicited Testimonials:—
"Knowing how difficult it is to obtain pure stocks of grass
seeds, even when price is a secondary consideration, I write to
say the supply I obtained from you for our new terrace lawns
has given the greatest satisfaction."

"Please send me three bushels of the very best Lawn Grass
Seeds, suitable for an exceedingly hot ripened soil. . . . The
seed I have had of you has been the only kind which has
been able to resist the influence of the sun and drought upon
my thin, gravelly soil."

FARM SEEDS

Of all kinds, which have given unqualified satisfaction. See

CLEMATIS, DAHLIAS, &c.
KING'S ACRE, near Hereford.—May, 1882

All the Season CINERARIA and PRIMULA SEEDLINGS.

We consider it only just to inform all those who have
a desire for the best PRIMULAS that we have been
awarded 12 FIRST-CLASS CERTIFICATES
at the most important shows during the last two years,
which is quite unparalleled, and it is well known that we
possess much the finest strain ever seen.

CINERARIAS.—We simply append the following
extracts, which clearly prove that we have also such the
nearest perfection strain in existence.

2s. per doz., 12s. per 100, post-free.

Magazine, April 1, 1882—Royal Horticultural Society.
"From Messrs. Cannell & Sons, Swanley, came VICTORY
CINERARIA, a superb Self, the flowers 2½ inches in diameter,
very stout in substance, and perfect in form, and of a rich
magenta-crimson colour."

Magazine, March 18—Royal Horticultural Society (14th).
"Messrs. H. Cannell & Sons' Cinerarias (Swanley strain) is
unquestionably one of the very finest in existence, the plants
being compact, and the flowers of large size and the finest
possible form. MARCH PAST is one of the most perfect Cinera-
rias yet raised. The group included several other most
excellent varieties, on one of which a First-class Certificate was
conferred."

The Gardener—Royal Horticultural Society, March 28.
"Cineraria called VICTORY, the finest that has yet been
shown, the flowers measuring nearly 3 inches across, perfectly
circular, with overlapping petals, and of a beautiful saffry
magenta-pink."

March 28.—"First-class Certificate was awarded to
H. Cannell & Sons for CINERARIA MR. CULLINGFORD,
a large, handsome, reflexed flower of great substance and
perfect form, and of a rich crimson."

Journal of Horticulture, March 16—Royal Horticultural
Society.

"Messrs. H. Cannell & Sons, Swanley, exhibited plants of
some remarkably handsome new Cinerarias, the flowers large,
of good form, and rich colour."

The Seedlings we now offer are from Self-sown Seed of the
above beautiful and other grand varieties.

H. CANNELL & SONS,

THE HOME FOR FLOWERS
SWANLEY

This Design was invented by Messrs. SUTTON & SONS, in July, 1861, and is their property.

No similar Design was in existence until long after this date, notwithstanding statements put forth which appear to contradict the fact.

Messrs. Suttons' Customers are hereby cautioned against imitations.

DANIELS'
CHOICE STRAINS OF
FLORISTS' FLOWER SEEDS,
For Present Sowing, Post-free.

Tip In the Rearing of Florists' Flowers from Seed, the first essential point is to secure carefully Hybridized Seed, saved from the finest flowers of the finest kinds, the chances of success in raising some really good varieties being vastly greater from a few plants, from seed of the choicest quality, than from a large quantity raised from seed of an inferior description.

	Per packet—s. d.

DANIELS BROS.,
Royal Norfolk Seed Establishment, Norwich.

EXHIBITION OF ORCHIDS.

B. S. WILLIAMS

Has much pleasure in announcing that he has determined to make a grand show of his flowering ORCHIDS, during the next two months, at home. The Exhibition will include, in addition to the usual stock of young Flowering Plants, all the grand specimens that he has been in the habit of including in his Collections, which have obtained the leading prizes for many years both at home and abroad.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition will contain large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LÆLIAS, ONCIDIUMS, CYPRIPEDIUMS, MASDEVALLIAS, VANDAS, AERIDES, SACCOLABIUMS, and other rare and showy ORCHIDS.

**AN EARLY INSPECTION IS RESPECTFULLY INVITED.
NO CARDS TO VIEW REQUIRED.**

A hearty welcome will be given to all who honour us with a visit.

CARRIAGE ROUTE.

Carriage Route from the West End is through Albany Street, Regent's Park, Park Street, Camden Town, Kentish Town, and Junction Road.

The North Metropolitan Tramway Cars, in addition to the Street Tramways Company's Cars, arrive at and start from the Nurseries, for the City and West End, every few minutes.

The Great Northern Main Line trains all stop at Holloway Station, which is within fifteen minutes' walk of the Nurseries. The Midland and Great Eastern Main Line trains all stop at Kentish Town Station, which is within ten minutes' walk of the Nurseries. The Midland, in connection with the Metropolitan Railway, runs frequent Trains during the day from all parts of London to Upper Holloway Station, which is within three minutes' walk of the Nurseries.

**VICTORIA AND PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.**

NEW ROSES FOR 1882.

WM. PAUL & SON,

(Successors to the late A. PAUL & SON, Established 1806.)

PAUL'S NURSERIES, WALTHAM CROSS,

beg to announce that they are now sending out strong plants of the following

NEW ROSES:—

DUKE OF ALBANY, H.P. (Wm. Paul & Son).

This fine variety produces large and full flowers of magnificent petal, vivid crimson in colour when first opening, but changing darker as they expand, and developing a beautiful shading of velvety-black. It has been figured in the *Floral Magazine* for November, 1881. Price 10s. 6d. each.

THE NEW AFGHAN YELLOW ROSE (Rosa Ecœ).

This interesting novelty has been recently introduced from Afghanistan, by Dr. Aitchison, and is figured and described in Nos. 117-119 (vol. xix.) of the *Journal of the Linnean Society*. The flowers are bright yellow, single, and exceedingly numerous, being borne on short lateral shoots all along the branches. 10s. 6d. each.

THE NEW FRENCH ROSES FOR 1882, including HELEN PAUL (probably the best light Hybrid Perpetual) and ULRICH BRUNNER FILS (Certificated by the Royal Horticultural Society). 3s. each; 30s. per dozen.

P.S.—In reply to numerous enquiries Wm. P. & S. beg to state that their new variety "QUEEN OF QUEENS" (Certificated by the Royal Botanic Society) will **NOT** be sold this spring.

ROSES in Pots, for Spring and Summer Planting.—A very fine stock or all the leading varieties, 12s. to 18s. per dozen; the same of extra size, 21s. to 30s. per dozen.

CLIMBING ROSES in Pots—The best kinds both for Outside and Conservatory Planting, at the same prices as the preceding.

ROSES in Pots, for Pot Culture.—All the most suitable varieties, 12s. to 18s. per dozen; extra strong established plants, 21s. per dozen and upwards.

Priced Descriptive CATALOGUES, post-free, on application.

CAUTION.—It having come to our knowledge that some unprincipled persons have been substituting other Manures for Clay's Fertiliser, we beg to state that we guarantee the genuineness of none except in our bags, marked:—

THE

Gardeners' Chronicle.

SATURDAY, JUNE 3, 1882.

EPPING FOREST.

THE patriotic public have enjoyed ample opportunities of learning the "whole truth" about the enclosures of Epping Forest, through the medium of the Press. The struggle, which forms a curious episode in the history of the Forest, began in earnest about 1842, and may be said to have ended in the visit of the Queen on May 6, in the Lord Mayor's baronetcy, and in the appointment of a superintendent of the Forest. The whole history from 1842 up to 1878, when the struggle practically terminated, was impartially related in the pamphlet, *Epping Forest*, motto *Suum cuique*, publishers, Hardwick & Bogue, Piccadilly. That the Corporation are the fit and proper guardians of the Forest those who know its history, and how the Lord Mayors hunted in this forest for hundreds of years, are perfectly aware. It is a curious history. All forests have had curious histories since

"Nature first made man,
Ere the laws of servitude began,
When wild in woods the noble savage ran."

But no forest history in England can compare with that of the extended woodland of which the Epping Forest of the present time is a mere remnant. When Julius Cæsar first described this forest, it comprehended Essex. In its depths and in its borders were, discarding British names, Colchester the capital, and London the second town of the chief British tribe. The fortresses of the British were, as Cæsar tells us, encampments in the deepest forests, hence the strength of Colchester, which the Romans presently won nevertheless, and hence the last stand of poor Queen Boadicea was made here in the centre of Epping Forest within a mile of the Superintendent's house. Here she marshalled and harangued her wild hosts, amazons included, and here the part played by trees in the defence of England, 500 years before she had a fleet, may be learned with advantage.

At the next stage of a very much abridged forest history, Harold having very richly endowed the Abbey of Waltham—a name signifying in Saxon "the town in the Forest"—the diminished woodlands of the district took the name of Waltham Forest, which included, 200 years ago, only about 12,000 acres of unenclosed woods and wastes, so that the enclosures must have proceeded from the British epoch in proportion as the population of the country advanced. We may conclude, therefore, that enclosures were not always hostile to the public interests, and it is obvious that Boadicean forests must be undesirable in a thickly populated country, while, on the other hand, 5,000 or 10,000 acres of public forest near London must be in every way a boon, except that it produces no food.

Hainault Forest, lying east of the river Roding, while Epping Forest has always been included in the long strip of woodland lying between the Roding and the Lea, was disforested by Act of Parliament in 1851, leaving

6000 open acres in the Epping part of the old Waltham Forest. This is the area, minus 400 acres, which has now been secured from further inclosure, and opened for the recreation of the public. The whole of the district watered by the Lea and the Roding is rich in historical memorials. Boadicea, the Amazonian queen of this part of Britain at the invasion of Julius Cæsar, fell here, near Loughton; "Harold infelix" was buried here in Waltham Abbey; Edward the Confessor lived within the bounds of the ancient forest at Havering Atte Bower, where he practised his devotions in seclusion amid the gloom of woods, exposed, as he said, to only one annoyance, the noise made by the numberless nightingales at a particular period of the year when they disturbed his midnight reveries. This same delightful residence was used by many of our kings and queens, including Elizabeth, who rode through the glades towards London on her Spanish jennet, stiff and starched, with a gay court round her, a Diana of three score. Among other visitors a reign or two later, were Cromwell's Ironsides, who left the sweet bower a ruin.

In the history of the Forest King Alfred figures conspicuously, and always as a hero. How he surveyed the camp of the Danes near Ware, on the Lea, at the risk of his life; and how he drained the river by a new channel to the Thames, and left their ships stranded and useless, may be read in the excellent account in the *Pictorial History of England*. All about Isaac Walton, too, and the Lea between Ware and Waltham, the paradise of anglers, may be learned from the *Complete Angler*, where some hospitable wayside inns are mentioned, which have since multiplied, and with them have grown, I am happy to add, the number of exceedingly pretty gardens—some attached to inns, some to cottages, and others, more ornate, belonging to the villa and suburban residences which, in all the prettiest parts of the ancient forest tract near London, are numerous and notable.

Every visitor to Epping Forest who alights at Chingford has admired Queen Elizabeth's hunting lodge, now restored and occupied by a "keeper"—a sort of perambulating policeman. The Royal Forest Hotel, hard by, entirely overshadows it, and exemplifies in its large proportions the needs and the wealth—far greater than that of kings and queens—of that potent power, "the public." Beneath the lodge lies Fairmead Bottom, and those innumerable visitors to the spot who have something more than a vague idea of the *genius loci* of the Forest, will here recall with interest the "Easter hunt," first held in 1226, and still continued as an annual though altered festival: not many years ago the *Illustrated London News* published an account of the revelries, enlivened by numerous cuts.

At Epping, on the northern edge of the Forest, other historical memorials crop up. There is a Maple tree between Eppingbury and the church, beneath which one of the manors held its Court-leet, and all the inns in the town—and they are numerous—claim the credit of having served as the harbours of highwaymen who in the last century infested the great roads to London and the dubious forest highways—Dick Turpin among them.

Near Chigwell, a convenient station for an unequalled farm-garden district, where the leviathan growths of Cabbages, and Onions, and vegetables for the London market farm 500 or 600 acres in crops of that kind, that celebrated village inn, the "Maypole" of *Darnaby Rudge*, John Willett, the landlord, was supposed to be situated. Hainault Forest, not far distant, disafforested in 1851, was grubbed up a few years later by John Fowler, inventor of the steam-plough, who drained it by steam-power, laying the pipes by

an ingenious arrangement of them strung upon a rope, and deposited with the aid of a "mole." The Fairlop Oak in this neighbourhood became the site of the Fairlop Fair about 1720, when Mr. Day, commonly called "Good Day," started the custom of distributing beans and bacon beneath the tree on the first Friday in July. A limb of the tree formed his coffin in 1767, and he lies in the churchyard at Barking. The tree was torn up by a storm in 1820, and furnished the oak for the pulpit and reading-desk of St. Pancras Church, Marylebone.

A very brief examination of the records of the past would reveal many other historical events and reminiscences connected with Epping Forest. Nature conferred on this part of Essex a rather poor soil, but time has left the Forest a valuable legacy, which, as already said, now forms the *genius loci* of the district, peopling it for ever, and far more effectively than the fairies ever did. The finest view from the Forest is, perhaps, that from High Beech, where the northern and north-western landscape stretches 20 or 30 miles beyond the neighbouring ruins of Waltham Abbey, over a level country of field and farm, once a forest like that which still hedges in the spectator, and still appearing, from this low eminence, a wood with "openings," instead of what it really is, a richly cultivated tract with trees in the hedges, and here and there a copse and patch of timber, or a wooded park. High Beech is a noted rendezvous for the holiday keeping million. The Queen drove to this spot on May 6, in opening the Forest, and planted a tree which one may hope may prove, in distant centuries, a memorial of the day. The Lord Mayor's baronetcy also commemorates the occasion.

During a long day in the Forest with Mr. McKenzie, who has held the office of Superintendent since the Corporation accepted the costly guardianship of the Forest, I became fully aware of the very valuable inheritance which the public have acquired. Mr. McKenzie's experience in landscape gardening and arboriculture is a guarantee that the £4000 a year he expends in wages will be well employed. The works already executed or in progress consist in drives and a lake, thinning and throwing down the miles of hedges and fences of illegal enclosures. The trees of the Forest generally, except in Monk's Wood, which the abbots of Waltham kept to themselves, have been mutilated for centuries by the ancient custom of lopping and topping. There are about 550 pollards per acre on an average, and that is more than twice as many as can ever produce, on such a space, fine heads resembling in the least degree the Burnham Beeches, whose picturesque appearance has been occasioned by the growth of the heads, springing from the rugged crowns of pollards since the pollarding was discontinued many years ago. The Beech prevails, but there are many Hornbeams and some Oaks, and, in fact, all the English forest trees and shrubs are represented in this ancient forest, including white Thorns, Crabs, and exquisite Birches. There is an avenue of black Poplars, growing rapidly, in the approach to Mr. McKenzie's house, The Warren, at Loughton, and his Rhododendrons on the lawn are very fine, and form an ample shelter.

A curious incident in forestry is that one year when the commoner's pigs were smitten with disease and unable to run out in the forest for their usual pannage, a thick crop of seedling Oaks and Beeches sprang up and, as the animals do not eat young trees, they still thrive.

At the time of my visit the nightingales, banished by the Confessor, had returned in great force and sang at mid-day under an unclouded sun, hidden in the thickets. It is satisfactory to know that a safe retreat will be preserved for them here in future, and that the wellbeing of the Forest is secured by the wealth of the Conservators and the skill of their accomplished Superintendent. H. E.

New Garden Plants.

OLEARIA GUNNIANA (fig. 113).

UNDER the name Eurybia Gunniana this beautiful flowering Composite shrub has been long known in gardens, but as Eurybia cannot be generically separated from Olearia the older name must give place to that here adopted. Olearia Gunniana, a fine specimen of which was shown recently by Messrs. Veitch, is a Tasmanian shrub of 3–5 feet in height, with hoary branches and polymorphous leaves. In the form before us they are oblanceolate, coarsely toothed, and hoary on the under surface. The starry flower-heads are very numerous, clothing the ends of the branches with a sheet of white. Each flower-head is about the size of a shilling, with spreading white rays and a greyish disc. In sheltered situations it would survive our winters, as we believe it does at the Combe Wood Nurseries, near Kingston-on-Thames, and its beauty is such that it may be safely recommended for cultivation in any suitable locality. Even in less favoured spots a very slight amount of protection would probably suffice to preserve the plant. In any case it would make a fine conservatory shrub, though we doubt if the blooms would be as handsome as they are out-of-doors. Olearia Gunniana was described as an Eurybia by De Candolle in the *Prodrômus*, vol. v., p. 268, and afterwards by Sir Joseph Hooker in the sixth volume of the *London Journal of Botany*, p. 107, as well as in the same author's *Flora of Tasmania*, vol. i., p. 175, where a coloured illustration of the plant is given.

MILTONIA WARSCEWICZII ATHEREA, *Rehb. f., Gard. Chron.* 1881, xv., 428.

When I described this very curious variety from a specimen kindly sent by Mr. C. Winn, I stated that it was new to me. Nothing comparable to it had ever come to my sight; and yet I had a fine wild-grown specimen which had been in my herbarium since 1879, collected by Sir Joseph Falkenberg as "a variety with a white lip," and kindly presented to me by Mr. F. Sander. It is in flower now at St. Alban's, and proves to be quite identical with Mr. C. Winn's plant—a fact which I could not guess from Mr. Falkenberg's dried specimen. H. G. *Rehb. f.*

HOYA GLOBULOSA, *Ilk. f., incl.* (fig. 115, p. 741).

This is a newly introduced species from the Sikkim Himalaya, where it was discovered by Sir Joseph Hooker, who is the sponsor for the name, though he has not hitherto, unless we are mistaken, published it. The plant was sent out by the Cranston Nursery Company, Hereford, who have exhibited it on several occasions, and who kindly furnished the materials for our illustration. It is a stove climber, with oblong leathery leaves, rounded or subcordate at the base, acuminate at the apex. The flowers, which have the same conformation as in other species of the genus, are in globose umbels, each flower being of a pale straw or cream colour, the coronal appendages pink at the base. The pods, according to the dried specimen in the Kew herbarium, are nearly a foot long, and very slender. Mr. Keenan, who met with the plant in Cachar, describes the flower as having a perfume like that of a Turk's-cap Lily. The plant has been previously figured in the *Floal Magazine*, 1880, t. 406, without botanical description. The curious way in which flies are caught by it (as in the case of the nearly allied *Apocynum*) has been recently described and illustrated in these columns by Mr. W. G. Smith. For garden purposes it is one of the prettiest of the Hoyas, its globose heads of flower being very attractive, while it is probable, from its native locality, that it may bear a cooler temperature than some of its allies.

EULOPHIA PULCHRA, *Link.*

Now they come, the Malagascarp plants! This one was sent, as far as I know, from the Comoro Islands, by dear poor Hildebrandt, who may not have seen the flower. I saw but weak plants, labelled as "Acanthophippium, No. 3," by some would-be orchidist.

A case has just been sent by Herr Kittel, jun., Hirschschäftliche Gärtnerei, Eckersdorf bei Glatz,

Kreis Neuroda, Schlesien. It contains an enormous plant from Hildebrandt's sending. It would hence appear, either that Herr Kittel had the first pick (which is not very probable at Berlin), or that he is a first-rate grower. The orchidist's heart beats higher at the sight of such a plant, intended to be only a specimen for naming. The stems are of the deepest green, and one is 2 feet high. The leaves are two, petiolate, oblong acute, the largest 2 feet by 7 inches. The part of the bulb just under them is fine, brown-purple. The younger bulb shows two mighty horn-like breaks of the same colour, one standing higher by two joints than the basilar one. The strong peduncle springs from the base of the third articulus of bulb; it has the same colour, excepting its green top and green lateral branches. Flowers very numerous, with linear lanceolate acute long bracts. Sepals and petals light yellowish-green. Petals with purple streaks. Lip with a short round green didymous spur, and with a four-lobed blade, with dark purple streaks. Column with similar longitudinal streaks in front. It

The plant being British Indian, might have been expected by the reader to have been sent from England. *Quod non!* It is now in flower with Herr Benary, of Erfurt, who is so well known for his warehouses filled with the finest seed, those of *Pensées* being proverbially appreciated. Well, Herr Benary took a hobby for Orchids. The other day Herr Oberhofgartner Wendland sent me from these a raceme of *Otocilius alba*, which previously I never had had from gardens, and now a grand living plant in this is sent direct by Herr Benary. *Vivant sequentes!* H. G. Rehb, f.

DENDROBIUM SECUNDUM (Lindl.) NIVEUM, n. var.

Messrs. Maule & Son, The Nurseries, Bristol, have kindly sent me a very fine inflorescence of this. Flowers quite snow-white, excepting the orange top of the lip, and the light green ovary. It is said to have the advantage of throwing its stems about 6-8 inches only, while the old pink one is much taller. H. G. Rehb, f.

only negligence of a gross and wilful kind could justify a charge of this serious nature, it must not be overlooked that this fatal tree, as well as numerous others which fell at the same time, might have stood safely for many years but for the terrible force of the wind, which so far exceeded all ordinary atmospheric conditions as to become productive of disaster. For such disasters, be they great or trivial, no man can be held responsible. None the less it is desirable that some proper precaution should be adopted in relation to trees that overhang or are in proximity to public thoroughfares.

That some other and similar catastrophes to the one above noted took place during that hurricane there can be little doubt, and, indeed, within a limited range, we can tell of a market gardener's van proceeding homeward, that was found by the driver to be suddenly pinned to the road by a huge tree falling on to its tail, thus giving the horses and driver but a very narrow escape. In another case a farmer driving home from market heard a

FIG. 113.—OLEARIA GUNNIANA. (SEE P. 732.)

is remarkably near *Eulophia Sandersiana*, Rehb. H. G. Rehb, f.

CRYPTOCHILUS LUTEA, Lindl.

This curious plant was very well understood and described by Dr. Lindley in his second and last contribution to the *Orchidology of India*. It appears to be very rare, it having only been known by the Doctor from Griffiths' specimens, and from Cathcart's drawings, kindly lent by Sir Joseph Hooker.

The specimen at hand appears to be in much better health than Griffiths' plant, it having stout bulbs and much shorter leaves. The inflorescence is very curious. The bracts stand in a biplicate order, and the nice light yellow urceolate tridentate flowers hang down in two rows, just as if they were small sulphur-coloured flowers of some new Lily of the Valley. The green ovaries are covered with white papillæ; the chin is very short and rounded; petals lanceolate; lip obtusangled rhombœo-lanceolate, all sulphur coloured. The column has abrupt upright horns, nearly as in a *Bulbophyllum*. The pollinia are nearly white, and this is the only statement I cannot describe in the same terms as Dr. Lindley. Both cases may occur, or Dr. Lindley thought it might be variable in colour.

DANGEROUS TREES.

THE prosecution at the recent Old Bailey Sessions of an estate agent, in the person of Mr. Oakley, member of a well-known firm, on the charge of manslaughter, was as novel of its kind as it was untenable. A large tree standing by the roadside was blown down upon an unfortunate passer-by during the hurricane of April 29 and killed him. The coroner's jury, doubtless naturally feeling that some one ought to be punished, returned a verdict of manslaughter against the estate agent. Coroners' juries are too apt to take their views of law from their own notions of what is right and wrong rather than from the Statute Book, and hence acquittals at the hands of judges as often follow as do convictions from such charges. In this case the only responsibility that could be charged upon the agent was that he had been warned that the tree might fall at any time, and no doubt it would have been wise to have attended to that warning, but we have no information as to whether the agent had authority to remove the tree, whether it was sought and refused, or even whether the tree was really in a more dangerous case than thousands of others are that stand by the roadside under similar circumstances. But whilst

sharp cracking sound come from a tree just beside him, and whipping his horse into a sudden spurt, just escaped destruction. It would have been absurd in these cases to assume that any one was wilfully negligent; but disaster might have happened just as readily as if some one had blundered. The moral of these accidents and hairbreadth 'scapes is, that trees of dangerous tendencies should not be planted too near to highways, and where they are so standing now it would be but right that some easement should be given them on the road side, so that danger might be minimised; not that any one would desire to see such trees distorted into the weird shapes and forms which disfigure the landscape of some of our home counties. Elms are the chief offenders, but Elms, grand as they are in all their bold outline and vigour, had better cease to exist altogether than to live as naked stems with brown heads, literally pictures of nursery burlesque—trees that degrade their tribe and render the landscape truly detestable. If, however, trees lend to our highways some elements of dauger at occasional, and certainly unrequited periods, they give in return so much that is picturesque, beautiful, and grateful, that their entire removal would be a loss far too heavy to be borne. Lopping at occasional intervals of all the more dangerous limbs would be productive

of dense growth, luxuriant leafage, and renewed exuberance; but it is just this occasional lopping which owners decline to carry out. With too many perhaps the market value of timber is of more moment than regard for human life, but judicious lopping can hardly be productive of loss to timber if it be performed with judgment, and in such a way as to relieve the trees from undue strain, without detracting from their market value.

One result of the great fall of trees during the winter and spring has been a remarkable fall in the market value of Elm timber, and it is stated that trees which would have obtained 1s. per foot under ordinary conditions will not fetch more than 4d. per foot. The timber trade has been glutted for some time to come with this wood, and buyers have got an abundance at their own price. Yet landowners have themselves largely to blame, because all the trees which have fallen have been the victims of too much top hamper. They have been left as sailing ships are, carrying a huge breadth of sail safely enough in ordinary weather, but in the fierce and often sudden storms have been taken aback, struck with the full force of the cyclone, and crashed to destruction. The carrying power of trees in exceptional weather should be studied and provided for. If these are unduly strained, ease should be given, and thus, whilst removing a source of danger, the tree will prove grateful by exhibiting renewed life and adding new elements of beauty. Our roadside trees, no doubt, are often permitted to become too lofty, and as hedge-row trees are not uncommonly crowded, such trees naturally grow weak and insecure. An expert woodman could soon remedy this, were he permitted. Highways that are overhung with trees suffer greatly from drip, and surveyors have to the overhanging branches a natural dislike. As these officials, however, are often farmers or persons somewhat dependent upon landowners, they hesitate to put in force the powers with which the law has clothed them, and insist on all such trees being lopped; were this the case, and the lopping done with skill and judgment, human life would be safer, the roads would be less injured, and the trees would lose nothing of that beauty which so largely tends to create picturesqueness in our English landscapes.

CLIVEDEN IN SPRING.

THE manifold beauties of Cliveden in spring have been so often commented upon in these columns that it would seem like repeating an oft-told tale to revert to the subject; and yet there is a charm about the spring gardening as carried out on the classic slope beyond "Cliveden's proud alcove" that is ever fresh and indescribably pleasing—a perennial delight that one never tires of. But a few weeks back the grassy banks and mossy glades were all aglow with the flowers of early spring—Daffodils and Daisies, Primroses, and Polyanthes, Bluebells, Squills, and wood Anemones, and wild flowers of all degrees, in a profusion that speaks volumes for the fostering care that has been bestowed upon them. At the present time the great banks of Rhododendrons that flank the drives and occupy other coigns of vantage are in all the glory of their early summer garb of floral beauty, and again would we say that the flower garden never looked brighter, never more harmoniously filled with the simple hardy annuals that form the sum and substance of the grand display. It is a sight, indeed, that once seen can never be forgotten. Long practice in this style of gardening, of which Mr. FLEMING may be said to be the father, has enabled him to successfully ring the changes on many plants, and by careful and constant selection to arrive at the results before us—every bed a perfect mass of colour at the same time—a triumph that it would seem almost impossible to improve upon.

As all visitors to Cliveden will remember, the design of the garden is composed of two sets of beds, divided by a broad stretch of grass, and terminated by an immense ring at the bottom, each set of beds consisting of eight elongated triangular patterns, scooped out on one side, the recess so formed being occupied by a circular bed. These small circles are all filled with a white-flowered variety of *Silene pendula*, a variety of Mr. FLEMING'S own sowing, and the large ring at the bottom, which takes 15,000 summer bedding plants to fill it, is occupied with the true *Silene pendula* only. Then commencing with the large beds

from the terrace end, they are filled:—1, with *Silene pendula*, pink; 2, *Nepeta cærulea*, blue; 3, Chinese Roses, with a broad band of Lady-grass or Gardeners' Garters; 4, white Rhododendrons, with a broad band of *Lasthenia californica*, orange-yellow; 5, *Linnanthus Douglasii*; 6, crimson Rhododendrons, John Waterer, surrounded by *Myosotis sylvatica*; 7, the old Fellenburg China Rose, surrounded by Lady-grass; and 8, white Rhododendrons encircled with the blue *Nepeta*. Nothing could be more simple than the materials used; nothing more costly could produce a finer effect. The annuals are sown in the last week in August or first week in September, and are pricked out from the seed-beds into their present quarters, a process that is found to give much more satisfactory results than sowing the seeds in the beds at once.

ASHTON COURT.

PERHAPS at no season of the year can a more pleasurable visit be paid to this fine domain, near Bristol, than during the month of May, and a few notes made during a recent hurried visit may not be uninteresting to your readers. The park, with its rare undulations and magnificent trees, is seen to the best advantage in spring, but on every hand were traces of the terrible gale of a short time ago. Many a huge Elm was knocked over like a mincepin by the fierce dash of the hurricane. It was curious to notice that in every case the tap-root, if any existed, had apparently rotted quite away to the very base of the trunk, leaving only the strong horizontal roots that spread near the surface of the soil as an anchorage. The devastation wrought by the gale of last autumn was seen in the gaps created in the fine avenues and clumps of Elms, the *Ashes* of which had only just been cleared away. The lofty specimens of Beech were prominent objects in the landscape, the bright emerald-green of the young foliage contrasting with the deeper hues of other arboreal giants. The common white Thorns, in the full flush of their spring bloom, were as beautiful as the eye could well desire.

In the somewhat restricted pleasure-grounds on the right of the mansion the beds of mixed Rhododendrons, with rich patches of high-coloured American *Azaleas* here and there, are objects of great beauty; huge bushes of *Deutzia gracilis*, clothed in a floral raiment of the purest white, harmonised with the crimson-hued Rhododendrons. The grouping of the American *Azaleas* is the work of a master-hand. Large bush trees of Paul's crimson Thorn, laden with flowers, looking very pretty, are dotted about on the greensward. Hedges of variegated Yew take on a surprising colour, owing doubtless to the presence of limestone in the soil, and bush trees of *Acer Negundo variegatum*, kept pruned back to restricted dimensions, are equally attractive, rich hues of red dashing the white variegation. On the rockwork at one end of the broad walk Ferns and rock plants luxuriate, and such flowering specimens of *Hoteia japonica* as one seldom sees in the open ground. These have been planted out for four or five years, and are never protracted. *Thuya aurea* colours finely in this locality.

In the plant-houses is much to attract attention. *Bougainvillea speciosa* in a cool-house is coming into fine bloom; Rhododendron Mrs. John Clutton is fine in pots, and makes a rare conservatory plant, being quite white, and small plants flower very freely; *Habrothamnus elegans* in small pots is flowering freely. Mr. Austen plants it out in June, and lifts the plants in September, and they bloom when lifted up to November; they are then cut back, and soon bloom again, and go on doing so all through the winter. Mr. Austen prefers to strike cuttings every year to make young plants for planting out.

Close by is a curious old Sycamore grove, the trees planted on either side of a broad walk. Originally there were some sixteen trees on either side, but a very few have succumbed to old age, or died from other causes. These trees must have been planted many years ago, and it is said there is some old family tradition connected with their presence here. For years past the trees have been cut back to something akin to pollards, and the consequence is they threw out branches across the path, and so formed a kind of covered way, and the stems have united with and interlaced each other in a remarkable manner. These Sycamores take on a very fine leaf colouring at this season of the year.

Some fine specimens of coniferous plants are found in the pleasure grounds; among them is a rare example

of the funeral Cypress, over 30 feet in height. All coniferous plants do well here: the subsoil is dry and well drained.

Against the walls of the mansion, and also the terrace walls, *Escallonia macrantha* makes a wonderful growth; and there are many other fine shrubs of this character. Camellias do well planted out. *Choisya ternata*, planted out against the terrace wall, is growing very freely. Against the front wall of the mansion the white Banksian Rose flowers very freely and finely. Growing against the balustrading of a large flight of steps leading from the lower to the upper terrace garden is an ancient *Wistaria sinensis*, that in the course of time has thrown out right away branches, the longest of which measure fully 100 feet. The plant bore dense clusters of fine racemes, with more blue in them than is generally seen. One branch was brought across, under the broad path, and, trained up the other balustrade, is gradually covering that also.

In the fruit garden everything is highly promising. The vineries are in the best condition, and there is a rare promise of fruit. In the Peach-houses wall and bush trees are laden with fruit, and overhead Grapes show the promise of an abundant and fine crop. In an annex to one of the vineries are some Vegetable Marrows in pots, the plants trained up stakes and so on to the interior of the roof. The seed was sown at the beginning of February, and the plants potted into 32's, and then into very large fruiting pots. The first brace was gathered the second week in April. This is a capital plan for getting Vegetable Marrows early in the season. In one of the vineries some plants of *Zephyranthes carinata* in pots were in full bloom, carrying fine deep fleshy-pink flowers. By their side were some plants of *Urcollina pendula aurea*, which are potted every spring, three and four bulbs in a pot, where they flower finely.

Like every other department, the kitchen garden at Ashton Court is in admirable condition. Mr. Austen has had to deal with a very stubborn, retentive, clayey soil, but by dint of perseverance he has brought it into something like subjection. All the outdoor fruit crops promise fairly well, vegetables are a great success. The early Munich Turnip should be noted as an exceedingly useful early variety. Sown in the open ground at the end of February, it is now fit to pull. The American Wonder Pea is an excellent early dwarf variety. Sown in the open ground on January 20 it has made a very fine branching growth, and on May 13 had formed some good sized pods. It grows only to a height of 15 or 16 inches in a strong soil, is very free, and pods in pairs. All the early Peas look well, and as late as earliest is concerned, it appeared to be a neck and neck race with the Early Champion, William I., and Emerald Gem. *R. D.*

CANADIAN NOTES.

We have had a very variable winter, constantly changing every few days, so that frequently, at the beginning of the week, the cutters and sleighs were in vogue for very respectable sleighing, and perhaps by Saturday the snow had partly melted and made the roads practicable only for buggies and waggons. The winter Whent shows some of the effects of this fluctuating temperature, although not so much as might have been calculated on, as it is only in a few districts that it is likely to be necessary to plough white fields up for spring crops. The winter has been a prosperous one for the farmer, and now the spring season, although cold till this last day or two, has afforded a good opportunity for ploughing and seeding the ground earlier than usual, as the land is nice and dry.

The money realised by the enhanced price of grain, hay, pork, and Potatoes, and an advance of something like cent. per cent. on many descriptions of timber when utilised into railway material, has enabled large numbers of farmers, farmers' sons, and tradesmen to take a trip to Winnipeg and try their hands at speculation in land, and arrivals from Europe of farmers and others swelling the multitude of those who are determined to get rich in a very short period has created a demand for individuals prepared to supply riches to order which has been abundantly met by sharpers, who have adopted many schemes to fleece the unwary speculators. They have sold them town lots at high prices in eligible city sites which when the enthusiastic purchasers come to see they found the only sign of civilisation to be a water tank along the railway-track. They have accommodated them with excellently fertile and well situated farms which on inspection have only turned out to be muskegs, or swamps are called, and utterly

valueless for any purposes of cultivation. They have sold them land which cannot be found at all. They have played on the cupidity of some of the resident farmers by purchasing their cleared farms at exorbitant rates and then sending one of their party to offer 2000 dollars more and suggesting that the farmer should buy the farm back, which he has accomplished by paying 500 dollars more than he sold at, expecting to realise 1500 dollars profit on the transaction, and of course never saw the original purchaser again. Town lots in Winnipeg have sold at extravagant rates, and in all other places where there is any population and speculation has almost equalled the South Sea Bubble in many instances, and many unfortunates have come to grief already. However, the great North-west is being rapidly settled by those who mean to make it their home, and its fertile soil, with a healthy although very cold climate, will afford comfortable homes for many millions of immigrants. The Government has sold sufficient land to large companies, mostly at 2 dollars an acre, to recoup themselves the 50,000,000 dollars promised to the Canadian Pacific Railroad, in addition to 50,000,000 of acres of land for constructing an iron highway from the Atlantic Ocean to the Pacific; and this spirited undertaking is attracting many noblemen and gentlemen from England, who are coming to share the spoils of this magnificent country, which has been for so many years only the pasture ground of the buffalo, the hunting region of the red man, and the reserved commercial fur-district of the celebrated Hudson's Bay Company's traffickers. *Ministry, Ontario, Canada, May 10.*

LIST OF GARDEN ORCHIDS.

(Continued from p. 642.)

- 198. D. RHODOCENTRUM, Rehb. l., *Gard. Chron.*, 1872, p. 425.—Native country unrecorded. First flowered by Mr. Wentworth Butler. Allied to *D. cumulatium*. Flowers light rose; petals tipped with purple; lip white, with a purplish stain at the apex, and a yellowish base.
- 199. D. RHODOSTOMA x Rehb. l., *Gard. Chron.*, n.s., v. p. 795.—A hybrid between *D. Huttonii* and *D. sanguinolentum*, raised by Mr. Seden for Messrs. Veitch, who exhibited it at the great Flower Show at Brussels in 1876. "Flowers whitish, tipped with rich purple."
- 200. D. RHODOPTERYGIUM, Rehb. f., *Gard. Chron.*, n.s., iii, p. 624.—Moulmein. Introduced by Mr. Boxall for Messrs. Low. Closely allied to *D. Parishii*. Colouring of the flowers in the way of *D. superbum*, wanting the velvety hairs on the lip, so conspicuous in *D. Parishii*. Hort. Kew. *D. RHOMBUM* = *D. aureum*.
- 21. D. ROSENBERGII, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv, reprint, p. 13.—Amboina. Buitenzorg Botanic Garden, 1862.
- 2. D. ROSEUM, Hort. = *D. crepidatum*, ex Planch., Hort. Donat.
- 3. D. ROTUNDIFOLIUM, Hort. = *D. speciosum* var., ex Planch., Hort. Donat.
- 201. D. (EUDENDROBIUM) RUCKERTI, Lindl., *Bot. Reg.*, 1843, t. 60.—Philippine Islands (?). Supposed to have been introduced by Cuming. First flowered in the garden of Mr. Sigismund Rucker, Wandsworth. A pretty species, allied to *D. aureum*, with flowers of a deeper colour within, though almost white externally. Flowers fragrant. Hort. Kew.
- 202. D. RUMPHIANUM, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv, reprint, p. 13.—Molucces. Buitenzorg Botanic Garden, 1862.
- 23. D. SALACENSE, Lindl., *Gen. and Sp. Orch.*, p. 86; *Proc. Hort. Soc.*, ii, p. 373. *Gravatum salacense*, Blume, *Bijdr. tot. Fl. Nederl. Ind.*, p. 333.—Java. Buitenzorg Botanic Garden, 1866; also cultivated by Messrs. Low. Inconspicuous.
- 204. D. SALICORNIODES, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv, reprint, p. 11.—Rakata Island. Buitenzorg Botanic Garden, 1866. Inconspicuous.
- 205. D. (EUDENDROBIUM) SANGUINOLENTUM, Lindl., *Bot. Reg.*, 1842, Misc., p. 73; 1843, t. 6; *Gard. Chron.*, 1842, p. 879; 1843, p. 143.—Ceylon. Introduced by Mr. Nightingale for the Duke of Northumberland. Stems and under-surface of leaves of a delicate purple when young. Flowers medium size, clear fawn colour, tipped with a deep rich violet, and having a scarlet spot on the lip. Hort. Kew.
- 206. D. SARCONTIUM, Lindl., *Journ. Linn. Soc.*, iii, p. 20.—Java. Buitenzorg Botanic Garden, 1866. Whole plant only 2 inches high.
- 207. D. SCABRILINGUE, Lindl., *Journ. Linn. Soc.*, iii, p. 15; *Journ. Linn. Soc.*, xxx, p. 150; *Gard. Chron.*, n.s., xii, p. 616. *D. doctroinum*, Bateman, *Bot. Mag.*, t. 5345.—Moulmein. Introduced by Rev. Mr. Parish for Messrs. Low in 1863. A pretty species, with short stems, clothed when young with black hairs. Sepals and petals white; labellum orange with crimson stripes.

- column green. Said to possess the fragrance of the Wallflower. Hort. Kew.
- 208. D. SCALEPPELLIFORME, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxv, p. 3.—Malayan Archipelago. Buitenzorg Botanic Garden, 1866. Inconspicuous.
- 2. D. SCHEINUM = *D. striolatum* (?).
- 3. D. SCHREBERI, *Exot. Flora*, t. 299 (copied from).
- 209. D. SCOPA, Lindl., *Bot. Reg.*, 1842, Misc., p. 55; *Gard. Chron.*, 1842, 597.—Manila. Imported by Messrs. Loddiges. More singular than beautiful. Flowers small, whitish, in axillary clusters; labellum cut up into long entangled curling threads.
- 210. D. (EUDENDROBIUM) SCULPTUM, Rehb. f., *Bot. Zool.*, 1865, p. 143.—Java, t. 12, p. 143.—Borneo. Discovered and introduced by Mr. Hugh Low, for Messrs. Low & Co., of Clapton. Flowers ivory-white, with a yellow labellum, about the size of a moderate *D. longicornum*.
- 211. D. (EUDENDROBIUM) SPECIOSUM, Wallich, *Bot. Reg.*, t. 253; Rehb., *Exot. Flora*, t. 299 (copied from *Bot. Reg.*); *Bot. Mag.*, t. 4332; Lindl., *Gen. et Sp. Orch.*, p. 81; *Vriese, Orch.*, t. 6.—Malayan Islands. Introduced from Sumatra, by Mr. W. McKilligin, and flowered in Mr. Tate's nursery, Sloane Square, London, in 1829. Stems stout, with short broad leaves; flowers small, purple, with a yellow labellum, in dense racemes from near the top of the leafless stems. Pretty and distinct. Hort. Kew.
- 212. D. (EUDENDROBIUM) SENILE, Parish, *Gard. Chron.*, 1865, p. 434; *Bot. Mag.*, t. 5320; *Venus*, ii, t. 15; Birtch., *Exot. Flora*, t. 299 (copied from Rev. Mr. Parish for Messrs. Low & Co.). A small species with wholly yellow flowers, except a few reddish transverse stripes on the labellum, in pairs or leaves on the short stem. It is very pretty, and at the same time remarkable in the stems and leaves being clothed with long white hairs.
- 213. D. (EUDENDROBIUM) SEKKA, Lindl., *Gen. and Sp. Orch.*, p. 71; *Journ. Linn. Soc.*, iii, p. 3.—Java, Singapore. Cultivated at Kew, 1861. Inconspicuous.
- 214. A. SINUATUM, Lindl. et Rehb. l., *Walp. Ann.*, t. 280; *Journ. Linn. Soc.*, Lindl., *Bot. Reg.*, 1841, Misc., p. 3.—Singapore. Introduced by Mr. Cuming, and flowered by Messrs. Loddiges. Allied to *D. anceps*; flowers pale yellowish-green.
- 215. D. SMILLIEI, F. Muell., *Fragm. Phytog. Austral.*, vi, p. 94; Benth., *Fl. Austral.*, i, p. 282; *Gard. Chron.*, n.s., x, p. 101.—New South Wales. Cultivated by Mr. Bull in 1879. Flowers small, in dense racemes, rose-purple, green and chocolate.
- 216. D. (APORUM) SPATELLA, Rehb. f., *Hamb. Gartenz.*, xxv, p. 298.—Assam, India. Imported and cultivated in 1864 by Mr. J. Day. Flowers small, greenish-yellow.
- 217. D. (EUDENDROBIUM) SPECIOSUM, Smith, *Exot. Bot.*, i, p. 17, t. 10 (very bad); Benth., *Fl. Austral.*, vi, p. 279; *Bot. Mag.*, t. 3074; *Bot. Reg.*, t. 1610.—Eastern Australia, Queensland to Victoria. Flowered in the Liverpool Botanic Garden in 1837 from a plant introduced by Fraser. A robust species, with ample foliage and large dense spikes of yellowish-white, fragrant flowers. Hort. Kew.
- 218. For HILLI, Hooker, *Bot. Mag.*, t. 526 (species); *Gard. Chron.*, n.s., vi, p. 112 (with a whole page figure. Sepals and petals narrower and paler than in the type. Described as a free-flowering and desirable species. Hort. Kew.
- 219. For BANCROFTIANUM, Rehb. f., *Gard. Chron.*, n.s., v, p. 762.—More slender than even the var. Hilli, but having flowers nearer the type in Australia. Introduced by Dr. Bancroft, and cultivated by Mr. Thomas Christy in 1851.
- 218. D. (DESMOTRICHIUM) SPHEGHILOGLOSSUM, Rehb. f., *Boissiania*, ii, p. 88; *Walp. Ann.*, vi, p. 200.—India. Introduced by Consul Schaller, Hamburg, about 1854. Allied to *D. scopia*. Flowers white suffused with rose.
- 219. D. SPLENDIDISSIMUM, Rehb. l., *Gard. Chron.*, n.s., ii, p. 298.—A hybrid between *D. aureum* and *D. nobilic*, or *D. macrophyllum*, raised by Mr. Seden, in Messrs. Veitch's establishment, in 1870. Sepals and petals cream-coloured tipped with purple; labellum yellowish with a blackish purple disc; column greenish. A very handsome Dendrobe.
- 220. D. (EUDENDROBIUM) STRICKLANDIANUM, Rehb. f., *Gard. Chron.*, n.s., vi, p. 749; *Venus*, iii, p. 71, t. 206.—Japan. Introduced by Sir C. W. Strickland. Flowers pale yellow and white.
- 221. D. STRIOLATUM, Rehb. f., *Hamb. Gartenz.*, 1837, p. 313; *Venus*, ii, p. 24, t. 109; Benth., *Fl. Austral.*, vi, p. 284; *Bot. Mag.*, t. 3074; *Bot. Reg.*, 1839, Misc., p. 32, non R. Br. *Exot. Bot. Mag.*, t. 5345.—Moulmein. Introduced by Mr. Nightingale for the Duke of Northumberland. Stems and under-surface of leaves of a delicate purple when young. Flowers medium size, clear fawn colour, tipped with a deep rich violet, and having a scarlet spot on the lip. Hort. Kew.
- 222. D. STROBILANUM, Rehb. l., *Gard. Chron.*, n.s., ix, p. 462.—India. Flowers densely racemose; sepals dark violet-brown at the base, the petals spotted with the same colour, margin and apex of the lip darker. I do not know whether this has actually been cultivated in this country. Dr. Reichenbach received "a new splendid representation of it" from Mr. T. C. Hinks, of Thirsk, in 1878.

(To be continued.)

ALPINE PLANTS.

(Continued from p. 670)

Gentiana acaulis, L., occurs in the high pastures of the Jura and throughout the Alps. The best plants of *G. acaulis*—those which succeed best, and which bear the finest flowers—are not those which grow in the pasturages, but those which are found in the fissures of the limestone rocks, and especially on the northern slopes of the Jura. Many people do not know how to cultivate *G. acaulis*, while others succeed without any trouble. It is evident that in hot, dry regions, the acclimatisation of this alpine plant presents some difficulty. In England, especially in the seaside districts, and where the air is constantly moist, this species succeeds admirably. The system of culture which we adopt in Geneva is the same as that adopted for *G. verna* and *G. excisa*. It must have a large pocket in the rockery, the bottom of which should be well drained with stones or pieces of coke. Above the drainage a good layer of rich and porous leaf-mould should be placed, mixed with calcareous sand in the case of *G. verna* and *G. acaulis*, granitic sand in the case of *G. excisa*. The aspect should be easterly or westerly. The plants should be thickly planted, receive an abundant supply of water in spring, but very little in summer and in winter. A very curious circumstance which I have observed in many alpine plants, especially in the case of the Soldanellas and plants which, unlike Saxifragas, have not the property of spreading, is that they are gregarious, living in masses, and not as isolated specimens. Social plants of this character are numerous. I have seen some fine edgings of *Gentiana acaulis* in flower in a garden where the plants grow separately did not succeed.

G. excisa, Presl, differs from the foregoing in its oblong obtuse leaves, longer than in *G. acaulis*, and by a different construction of the calyx. While *G. acaulis* has the calyx divided to the base into five free segments, the calyx of *G. excisa* is divided only half way down. Moreover, *G. excisa* flowers as a rule a fortnight later than *G. acaulis*. *G. acaulis* is a limestone plant, while *G. excisa* is found on schistose or granitic soil.

G. alpina, Villars, differs from the preceding species by its shorter and more slender stem, by its small oval leaves, and by its oval calyx lobes. Its corolla, moreover, is only half the length, but is relatively broader than that of *G. acaulis*. It occurs only in the highest alpine pastures, and especially in the granitic districts. This species abounds in the Pennine Alps, in the Valais, and in the Dent du Morcle, as also in the higher parts of the Grisons. It may be cultivated like the others, but with even more perfect drainage, consequently with a thinner layer of soil, consisting of peat mixed with granitic sand. I add to this compost a little sawdust.

G. verna, L., is no doubt after *G. lutea* the most widely spread species. It is met with throughout the greater part of the central European mountains. Its cultivation is easy, but it does not succeed well unless grown in masses. I think lime suits it better than granite. Nevertheless, it is met with in other than limestone soils, though in such localities it is less robust and less beautiful. It requires a soil rich in humus mixed with a little sand. I have discovered a white-flowered variety, which remains constant and flowers every year. What is very remarkable is that the white-flowered variety of *G. verna* which I brought from the Valais produced blue flowers under cultivation, while that which I procured from the Jura remained white. The white variety occurs mixed with the blue in the Jura, forming a very pretty contrast. *G. verna* frequently flowers a second time in autumn when the summer has been very dry. Thus, last autumn the summit of the Grand Salve was covered with the flowers of *G. verna*.

G. brachyphylla, Villars, grows in the highest alpine pasturages. It resembles *G. verna*, but its leaves are broader, thicker and spatulate. It grows in a cool moist soil.

G. hucarica, L., is one of our most beautiful species. It grows on the very edges of the glaciers, and I have often met with it at great elevations on our Alps where glacial species only occur. No *Gentiana* is more beautiful than this when it grows amid the crevices of the rocks. I have found it near the summit of the Schwarzwasser, accompanied by *Eritrichium nanum* and *Androsace glacialis*. It lives at these elevations in a sterile gravelly soil, which is continuously moistened by the melting ice. The plant varies in character according

as it grows at higher or lower elevations. Some botanists have considered the form which grows in the lower pasturages as a distinct species, and have given it the name of *G. imbricata*. In cultivation it is evident that the plant of the lower regions is to be preferred because it succeeds best in the low ground. The form which occurs in the higher glacial regions is very difficult to grow, rarely flowers, and never so alpine as its native heights. I grow it like *G. alpina*.

G. nivalis, L., is a very pretty annual species, which grows also at great elevations, and which must be grown every year.

G. ciliata, L., is an autumn-flowering species. It is not alpine, but belongs to the lower regions, being found in woods and copses throughout the Swiss plateau. This charming species has very bright blue flowers, ciliated and fringed at the edges. It requires a porous peaty soil, mixed with a little lime. There is also a white-flowered variety of this species.

Seedling plants of the *Gentians* succeed very well, but patience is required, because the seeds take a year and a-half or two years to come up. If the seeds are sown immediately they are ripe they do not come up for a year, and if sown in spring they will not germinate for eighteen months or even two years. Nevertheless, the *Gentians* raised from seed are much better than those which are transplanted. There are some, such as *G. ciliata*, of which it is very difficult to procure roots, because they are provided with small white stolons, which are often taken for roots, but which are underground shoots. To get at the true roots one must dig deep. *Henry Corcecon, Inspecteur du Jardin Botanique de Genève.*

WASTE LANDS IN INDIA.

We are requested by the Secretary of State for India to publish the following statement with reference to the waste lands available for planters in the Tavoy district:—

Waste lands, covered at present with forest, Bamboos, or grass, are available for plantations of Coffee, Tea, Cinchona, or spices at altitudes varying from 100 feet to 6800 feet above the sea in the Tavoy district. This region is between the 13th and 14th parallels of North latitude, and the rainfall ranges from 190 to 220 inches a year. The lands are mostly within 30 to 50 miles of the steamer station of Thayetchoing on the Tavoy river. Mail steamers ply between Thayetchoing and Moulmein or Rangoon once a week inwards and outwards, beginning from January 1, 1882.

II. Grants of land in lots ranging from 100 to 1200 acres can be had for planting Tea, Coffee, Cinchona, or spices on application to the Deputy Commissioner of Tavoy. Such grants will be made in accordance with the "Burma Land and Revenue Act, 1876," and with the rules sanctioned thereunder by the Governor-General of India in Council. Copies of the Act and rules can be obtained by intending planters on application to the Deputy Commissioner of Tavoy, the Commissioner of Tenasserim at Moulmein, or the Secretariat, Rangoon.

III. In addition to the concessions and conditions laid down in the Act and rules, the following special concessions will be made to persons taking up land for plantations of Coffee, Tea, Cinchona, or spices in Tavoy, namely,—(1.) A grantee will become proprietor of his grant as soon as he brings under cultivation one-third of the area thereof. (2.) A grantee will not be liable to pay any land revenue, or any price for the land of his grant, until the end of the tenth year after he enters on possession, provided that he takes *bonâ fide* steps to cultivate a reasonable proportion of the grant with Coffee, Tea, Cinchona, or spices. In the event of any grantee desiring a more precise definition of a "reasonable proportion" the Chief Commissioner may decide beforehand in each case what proportion of the grant ought to be thus cultivated in each year. (3.) After the end of the tenth year the grantee will be liable to pay land revenue, at the rate of 1.4 rupees per acre, and cesses at the rate of 2 annas per acre on one-third of his grant up to the year 1900 A.D.; after the expiration of such year he will be liable to pay for one-third of his grant the same revenue rate as is paid for garden lands in the nearest revenue circle where a garden rate obtains. (4.) A grantee will not be called upon to pay anything for timber, Bamboos, or grass which he may cut upon his grant, provided he takes *bonâ fide*

steps as aforesaid to cultivate Coffee, Tea, Cinchona, or spices.

IV. The only payment which a grantee will have to make, on receiving his grant, will be 8 annas an acre for the costs of survey and demarcation. In consideration of such payment, the Deputy Commissioner will cause a survey to be made of the grant, will furnish the grantee with a copy of such survey, and will cause boundary marks to be erected at suitable points in the outer boundary of the grant.

V. The wishes of applicants will be met as far as possible in regard to the situation and shape of their grants. But ordinarily—(a) No grant will be given where the Forest Department intend to make a forest reserve. (b) No grant will be given on such a place as will unduly circumscribe the extension of cultivation of the grazing grounds of any neighbouring village or hamlet. (c) Grants facing a road or navigable stream will have to be of a depth double the length facing such road or navigable stream. (d) Small strips will be reserved leading to landing-places for the benefit of neighbouring villages and grants.

VI. The Government is now spending much larger sums than heretofore on roads in the Tavoy district. It is settled in the district that further funds will be allotted for roads from their neighbourhood to the steamer station at either Tavoy or Thayetchoing.

VII. In order to encourage pioneers in the Coffee and Cinchona enterprise in Tavoy, the Government will pay to the first four grantees who begin *bonâ fide* planting operations 15 rupees per head for every Indian or Chinese coolie, male or female, over sixteen years of age, who may be settled and housed on their plantations before March 1, 1885.

VIII. In any case of doubt regarding the *bonâ fide* character of operations, or for the purposes of Concessions III. and VIII., the Deputy Commissioner will decide, and his decision will be subject to appeal to the Commissioner of Tenasserim, whose decision will be final.

IX. All minerals and metals under and within the lands granted under these rules are reserved by Government, together with the right to enter upon and resume such portions of land as may be necessary for examining or working mines, upon payment of just compensation to the grantee for loss of, or injury done to, the surface.

The Roseary.

CHINA ROSES EVERYWHERE. — Wherever these Roses succeed they do in many parts of Devonshire they are about the most profitable investment in the way of plants that all interested in what is both beautiful and useful can direct their attention to. A plant that will grow under the shade of other trees, and flower luxuriantly there, is a rarity among plants of any class, and it is even more so among Roses, the majority of which require special care and cultivation. For covering walls of almost any height they are especially useful, inasmuch as they are seldom without flowers even in the depth of winter, and during the spring months they not only adorn a wall, but they also supply unlimited quantities of cut flowers. At Mamhead House, the seat of Sir Lydstone Newman, Bart., the garden is literally aglow with these flowers, and has been so for some weeks past. Go where you will there is the old China Rose, looking more like July than May. Upon walls both high and low, covering unsightly places with a luxuriance of leaves and flowers that would gladden the heart even of the greatest of our great champion Rose-growers; in shrubby beds and borders, now a group of floral beauty *en masse*, or an isolated bush home to the flowers; climbing up a lead of unexpanded buds and flowers; climbing up the bare stems of naked trees, and clothing them with clusters of flowers which no other plant is capable of yielding in equal profusion at this season—at all events, not under the same circumstances, and under similar conditions. Planted round the stems of a group of *Magnolias* the effect is exceptionally bright and lovely. In no case should the plants be tied stily, or the beauty and natural effect will be spoiled. The habit of a bush grown in Nature's own way is sufficient to indicate that anything like stiff training is as unnatural as it is unnecessary. There are so many ways of adding both interest and beauty to a garden, even a small one, that one might dilate to any length upon the subject. One word more, however, about the old China Rose. A plant of it established at the base of a Portugal Laurel, which has travelled a distance of 15 feet or more, and now overhangs a considerable portion of the bush in question, in full flower, would convince even the greatest sceptic in gardening that we have not yet exhausted all the means by which a garden can be made more beautiful and interesting.

Orchid Notes and Cleanings.

WORK IN THE HOUSES.—In the management of Orchids or any other plants under glass it is necessary that those in charge of the houses should study the weather, so as to be able to judge pretty accurately whether the day is likely to be bright or cloudy. During bright days the fires should now be damped down the first thing in the morning, and the hot-water pipes should be cooled as quickly as possible to prevent a mixture of sun-heat and fire-heat, which never blends well, and is always more difficult to keep charged with moisture, and an atmosphere of this nature is generally the forerunner of thrips and other insect pests. On the contrary, when the days are cloudy and the nights cold the fires should be kept in such condition that they are ready to act should a sudden spell of cold weather set in, as a check to the plants at this season when their growths are young and tender is easily given. Another point beginners should be guarded against is syringing their plants. There are a few plants that will stand syringing, but in a mixed collection much mischief is often done with the syringe. The only use we make of it is to dew the cool Orchids over in the evening after a very bright day, but in this case we only let the moisture fall on the plants like a mist. This practice, if carried out carefully, will be found very invigorating to the plants, and at the same time every available surface in the house should be heavily damped over. The autumn and winter-blooming *Lælias* will now be growing freely, and should occupy elevated positions near the glass. Avoid watering them too freely. *Lælia* anceps Dawsoni is the gem amongst these, but for yielding a good supply of useful flowers *L. albida* should be grown in quantity in all collections. *Lælia elegans* will be about in condition for being re-potted or re-surfaced over. The fine summer-blooming *L. purpurata* will now or soon be in perfection, and good forms of this are hardly surpassed by any other Orchid. *Catleya Skinneri* should now be re-potted if necessary. This is one of the most distinct in the genus, but it is not one of the best in constitution. It should be grown in the coolest end of the Cattleya-house, and in potting it very little material should be placed about its roots, and this should be of the best fibrous description, placed over ample drainage. As the plants of *Odontoglossum vexillarium* go out of flower the plants must be carefully cleaned, and should be placed in the lightest and warmest part of the cool house, to give them a slight rest for a month or six weeks, when they will break stronger and freer for the change. Some of the best *Cypripediums* will be in right condition for a shift, but any that require breaking up through any cause had better be left till the end of the season. C. Stonei, C. Lowii, C. caudatum, C. villosum, and C. Parishii, are among those referred to. Most of these will grow freely in good fibrous peat from which the finer particles have been removed. Give good drainage and a regular supply of moisture to the roots at all seasons. The *Dendrobium* will take a good share of attention just now, as some of the forwardest of those that flowered early in spring will now be growing freely, and will require liberal treatment to bring out their growths to the finest development; while those that are only now going out of flower must be re-surfaced or re-basketed at once, and put under growing conditions. The fine summer flowering *D. moschatum* will now be showing its spikes, and may receive a little extra moisture at the roots. During changeable weather attend carefully to the shading over all classes of Orchids, and avoid keeping the blinds down longer than is really necessary for the safety of the plants. *J. Roberts, Gunnersbury.*

DENDROBIUM DENSIFLORUM.—The annexed illustration (fig. 114) was prepared from a photograph kindly sent up by Mr. W. Macdonald, of Perth, and which represents one of his four plants which took a 1st prize in the Edinburgh Show on April 5. It is about 2½ feet through, and bore forty spikes with an average of forty flowers on each—a very well flowered specimen for its size.

MR. BULL'S DISPLAY OF ORCHIDS IN FLOWER.—Mr. Bull has again this year brought together the principal portion of such Orchids from his rich and extensive

collection as are in bloom, and a wonderful display they make. They fill one of the large span-roofed houses containing a centre stage separated from the side stages by a path all round. Associated with them are a few well chosen fine-foliaged plants, such as the more elegant leaved Palms, Cycads, Anthuriums, Aralias, Ferns, Dracaenas and others of a like description, present in just enough numbers to relieve the unbroken sheet of colour which, despite the endless diversity of form, and innumerable shades and tints of the flowers, would otherwise be excessive. It is only within recent times that it would have been possible to speak of such an assemblage of these plants in bloom, but it is only of late years that collections have been in existence containing such numbers as to admit of some 1500 flowering plants, such as Mr. Bull's exhibition consist of, being brought together in one establishment. As a matter of course the *Odontoglossums* furnish the largest contingent to the display; the many forms of *O. vexillarium*, from those that are almost white

sepals and petals are in striking contrast with the more than usual extent of purple and yellow that covers the massive lip; another with sepals and petals quite white, the lip presenting a series of distinct lines of pale purple running through where in most cases there is a solid blotch. Some half dozen examples of *Ceologyne Lowiana*, with its strange combination of colours, unmistakably assert their presence. Amongst the predominating lighter shades there is a grand form of *Lælia purpurata*, petals and sepals quite white, with the deepest purple lip; and *L. majalis*, one of the most lovely of this grand genus. Those named are only a fractional contingent of the beautiful display brought together, the vigorous healthy condition of which is not their least remarkable feature.

ORCHID SEEDLINGS.—Having sown seed from an imported pod of *Dendrobium crassinode* that came from Sanders' large importation, part of which I purchased on February 1, I have already over twenty-five

facts: The ovary is straight, not twisted as it usually is; the bract protrudes from the side of the ovary, not from its base; the sepals, instead of being "free," are joined at the base—that is, they have never been separated, and so they form a sort of imperfect tube on the top of the ovary, as in *Masdevallias*, and from the middle of this tube spring the side petals, which should come off at the sides of the column. Lastly, the lip is pressed up against the central stem instead of being turned outwards. Now, what does all this mean? First, as the ovary is not twisted, the lip is in its original position as it was in the very beginning of the individual flower, and as we may reasonably suppose it was in the progenitors of these Orchids. As the lip grew bigger, to facilitate insect visits, the position against the stem would be inconvenient as presenting the expansion of the lip—a twist would set all matters straight. Then, as to the unusual position of the bract. The outer fleshy part of an Apple or a Pear is not fruit but fruit-stalk—part

FIG. 114.—*DENDROBIUM DENSIFLORUM*. (SEE P. 736.)

to the darkest varieties, are alone worth going some distance to see; the delicate shades of these are lit up by an intermixture of the brightest *Masdevallias*, including many forms of *M. Lindenii* and *M. Harryana*. One of the latter bearing the varietal name of *regalis*, is, indeed, a regal flower, both in size and the intense depth of colour it possesses. This superb plant carries some twenty of its indescribably rich tinted flowers. Many other varieties of extreme rarity are present, amongst them being a remarkable hybrid *Odontoglossot*, bearing a huge half-erect seven-branched spike of bloom $2\frac{1}{2}$ feet long by 20 inches across, having over sixty flowers individually of extraordinary size; the lip is white, barred with reddish-chocolate, sepals lined with crimson as in *O. hebraicum*, the body of the flower creamy-yellow, heavily marked with chestnut. In the numerous forms of *O. citrosimum* is one with the whole of the parts—sepals, petals, and lip—deeply suffused with pink. Of the many distinct forms of *Cattleya Mossie* there are two especially deserving of mention—one bearing enormous flowers in which the pure white

seedlings up, with two leaves on them. They were sown in the basket of a *D. Cambridgeanum*, then growing, and the result is, they are now up, and are strong little fellows. Mr. Dominy, who was here on May 24, was astonished to hear of so rapid a growth. Is not this almost unprecedented in the germination of *Dendrobium* seed? I have also a pod of *Lælia anceps*, now almost ripe, that had been fertilised only last January. Is this not also very fast ripening? The season certainly has been very sunny. I should much like to know other hybridisers' experiences on these points. *D. E. C.*

A RETROGRESSIVE ORCHIS.—Among the questions every botanist puts to an Orchis are these: "How came you to have such an odd appearance?—why do you differ so greatly from the rest of the army of monocotyledonous plants?" and this intelligent inquisitiveness is enhanced when perchance a distorted Orchis makes its appearance. One such is before us, in the shape of a specimen sent by Mr. D'Ombrian, of one of our common wild species. These are the

of the stem of the plant—and from its sides sometimes protrude leaves. So in the Orchis the outer covering of the ovary is not ovary, but it is a portion of the stem hollowed out in course of growth and adherent on the inner surface to the true ovary. If so, what more natural than that it should produce from its side a leaf or bract? Or the latter may have been uplifted with the stem in its growth. The union, or rather the absence of separation of the sepals, is not at all uncommon; it simply indicates a sort of arrest of development in virtue of which sepals which should in process of time become disjointed and free, remain in union and form a tube. Is it, therefore, any great stretch of imagination to connect the long-tubed Irises and Amaryllids with the Orchids and to suppose that the ancestors of existing irregular Orchids were in some respects like the regular tubular flowered Crocuses and Narcissuses of the present? Of course, the converse is possible—that the Orchid type is the oldest, and that the more regular type is an offshoot from it; but, to our thinking, the evidence is all the other way, and goes to show that the Orchids are relatively a modern highly specialised offshoot from simpler progenitors.

Notices of Books.

The Rose: a Treatise on the Cultivation, History, Family Characteristics, &c., of the Various Groups of Roses, with accurate Descriptions of the Varieties now generally Grown. By H. B. Ellwanger. New York: Dodd, Mead & Co.

This is a little book with some defects of its own, many merits of its own, and a large infusion of characteristics, taken with due acknowledgment and honest recognition from other works on the same subject. It is a treatise which, although not original, and which, though written for a different climate to ours, is one which we should decidedly advise the English rosarian to possess. Beginning with the classification of varieties, which is not very satisfactory as it stands, and which wants working out on the lines followed in a subsequent chapter on the characteristics of certain Roses taken as the types of groups, and which we may subsequently refer to more at length, we come to a chapter on technical terms, which is, perhaps, the worst in the book, and which we should be glad to see entirely reconstructed. Then we come to some practical chapters on cultivation and propagation which are short and to the point:—"All the large commercial establishments [of the States] do most of their Rose propagation in the months of January, February, and March; the cuttings are made to one eye and dibbled in beds of sand, or in some cases are placed in pots of sand, and these pots plunged in beds of sand; underneath the staging which supports the cuttings run hot-water pipes or flues; these are commonly boarded in to secure bottom-heat. . . . The best results follow where plants are propagated in a bed at a temperature of about 70° with the temperature of the house a few degrees less. After the cuttings have taken root they should be potted in pots not exceeding 2½ inches in diameter. . . . The sorts most difficult to root are the various varieties of moss, most of the summer Roses, and certain of the hybrid perpetuals belonging to the Jules Margottin, Baronne Prévost, and Baroness Rothschild families. All the Tea and monthly Roses, with very few exceptions, root and grow freely from cuttings." The historical details given in the twelfth chapter are valuable, and we think fuller than have been before given in similar works.

The instructions given to amateurs as to the points to be looked to in distinguishing different varieties and estimating their relative merits are so serviceable as to merit citation:—"The flower is naturally the first to claim our attention; observe first the colour, second the form, degree of fulness and size; third, the fragrance. Next examine the vigour and habit of growth, whether the shoots are upright or spreading, the joints between the leaf-stalks [internodes] whether close together (short joints), or widely separated (long joints); the thorns, whether they be many or few in number, their thickness, length, colour, whether straight or hooked; the leaf-stalks and foliage, whether the leaflets be five, seven, nine, or eleven in number; the colour of the foliage and lark, sometimes dark green, sometimes pale, occasionally brown or red; further, whether the leaves be small or large, round or long, indented or regular [?], glaucous and smooth, or curled and rough. Then also we have to consider the productiveness and continuity of bloom and the hardness of the plant." Mr. Ellwanger tells us that as a general rule, subject to occasional exceptions, he has found that hybrid perpetuals with seven leaflets are light-coloured sorts, there being, according to him, no red or crimson hybrid perpetuals which bear seven leaflets to each leaf. Of course we must leave a wide margin for exceptions, but supposing this statement can be confirmed by the experience of others an important point will have been gained. Isolated details are a nuisance, but when they can be naturally co-ordinated and brought together they then become valuable tell-tales, and give a clue to the history of the plant and its characteristics. To those to whom unfortunately the romance of the life-history of plants seems not worth the trouble to unravel such distinctions would appear in the light of useless trifles were it not for the circumstance that the practical utility of these distinctions is getting pressed home by the increasing number of "too-much-alike" Roses. "As a practical illustration. . . we invite the amateur," says the author, ". . . to study and compare Alfred Colomb, Marie Baumann, and Marie Rady—three of our best Roses—sorts which have many qualities in

common, so much so, that the inexperienced, when first observing them together, might pronounce them the same Rose. But the expert at once sees distinctive traits that separate one from the other; he notices that Alfred Colomb is the darkest in shade of the three; that it has a more globular pointed bud and flower than Marie Baumann; that the wood is much more smooth than the others; that late in the season the flowers have more substance, and are of better quality than Marie Baumann; so, early in the year, he would select Marie Baumann or Marie Rady as in a degree the most beautiful; the former more circular and symmetrical, if possible, than Alfred Colomb, the latter with more substance, and better filled out; and so, continuing the examination, it is found that these Roses are sufficiently distinct one from the other, both in flower and habit, to make the presence of all three most desirable in all choice collections." Incidentally we may remark that it would be very interesting and important if Mr. Ellwanger, or some other rosarian with a competent knowledge of the Roses in their European aspect, would study and indicate what changes are produced in their appearance after having been grown in the climate of the various States of the Union. We all know how marked is the change in the appearance of the American descendants of European parentage after a comparatively short time. A distinct race is slowly but surely being evolved, and this leads us to Ellwanger's chapters on typical Roses and the characteristics which are common to certain varieties in different classes. The great advantages of some system of classification are obvious, and it is a wholesome sign to see the practical rosarians admitting the fact. "If," says our author, "new Roses were described as belonging to the La Reine, or Victor Verdier type, we should have some very important knowledge of their qualities, since these Roses have imparted to their progeny certain distinct attributes by which they may readily be distinguished from others." He then goes on to indicate the following typical groups, taking their name from their most prominent representative, thus:—Baronne Prévost, La Reine, Giant of Battles, Général Jacqueminot, Victor Verdier, Jules Margottin, Sénateur Vaise, Charles Lefebvre, Prince Camille, Alfred Colomb, Duke of Edinburgh—all these are hybrid perpetuals. Among hybrid Noisettes three types are indicated—Mademoiselle Bonnaire, Madame de la Rougemont, and Gloire de Dijon.

The idea here sketched out, is one that has occurred to Rose, and indeed finds constant expression when one Rose is described as "in the way of" or similar to some other. Mr. Ellwanger must be aware that however excellent the idea, it is of no use to novices in the way he puts it before them. A beginner would have to read through all the characteristics of the dozen or more types, and compare them, before he could ascertain to which type any particular Rose might have before him belonged. Long before he reached to the end of his task, he would become confused and give up the task; but if he could be led on step by step by an analytical process of selection and rejection, selecting those points in which his Rose agreed with the description, and ignoring those which do not apply to his specimen, he would, after several such operations—each step surer than the last—find the type he wanted.

The admirable analytical tables employed by Dr. Asa Gray, and other American botanists, in their popular "Floras," supply an illustration of our meaning, and may be recommended to Mr. Ellwanger as models. It is true that great patience and much careful labour are involved in the preparation of such tables, and that they can only be done satisfactorily by experts with full knowledge of details, and of their relative importance, but the result is so valuable as to amply repay the labour.

With reference to the raising of new varieties, we are glad to see Mr. Ellwanger advocating cross-fertilization rather than continued selection of seedlings from one or a few types. No one doubts that splendid results have been hitherto produced by acting on the latter plan almost exclusively, but now that the cry has gone up against "too-much-alike" Roses, it is time to consider how best to obviate this difficulty and to encourage new breaks. From this point of view, such experimenters as Mr. Bennett deserve more cordial recognition than they have yet gained. It is true that some of his new Roses have objectionable qualities, and do not come up to the standard, but the man who makes experiments must

expect to fail in the full assurance that through failure lies the road to certain success. Judgment and experience are not gained in a day, but their employment is sure to lead to success in the end. From the haphazard procedures we can scarcely hope for a new break except perhaps by way of a "sport." From the well-devised procedures of the hybridist, among many failures there is almost an absolute certainty of ultimate success, but then the right sorts must be crossed, and the determination of what are the right sorts is a matter of judgment and patient experiment. The author tells us that "crossing varieties of the same type will produce seedlings of the best form and finish, blending sorts of different types will bring forth the most distinct kinds," and this proposition is no doubt in a general sense true. It is also true that if weakness of constitution be the result of the crossing of extreme types—a circumstance we do not believe to be at all invariable—that defect could be cured in another generation by judicious infusion of the characteristics of some robust hybrid variety.

The last chapter in the volume before us is devoted to a full descriptive catalogue, with synonyms of modern cultivated Roses. That there is choice enough is obvious, from the circumstance that over 900 varieties are thus catalogued.

We have devoted space out of proportion in extent to the size of the little volume upon which we have been commenting, but we have done so in the hope that the author may be enabled by careful comparative study, and by working out his own ideas with such modifications as experience shows to be necessary, to produce a work worthy to take rank among the foremost in its class. We look upon the present volume, good as it is, as tentative only—as a seedling of very high promise and much value as it stands, and with great capacity for progressive evolution and improvement in the future.

The Flower Garden.

WITH the preparation of the beds and all hardy things planted as before recommended, the planting out of the tenderer plants for summer display will be greatly facilitated, and by concentrating a little extra labour on those operations a thorough transformation in the appearance of the flower garden is soon effected. After such an unprecedented and favourable winter and spring the stock of bedding stuff should be unusually good, so that the operator will be enabled to give the beds a better furnished appearance than usual; but at the same time the future size and habit of growth of the plants must be studied, and if possible sufficient room allowed for their proper development; much, however, will depend upon the season when the greatest display is required, and if late, a greater laxity may be allowed with regard to the number of plants; but if a fair display is required all through the season, there should be a sufficient number of plants to give a tolerably well-furnished appearance from the first, and to keep them in bounds the use of the knife amongst strong-growing kinds, and of the thumb and finger among those of smaller growth, will be constantly required. All bedding plants in pots, and all such as have been turned out of them in temporary erections, should be watered sufficiently to thoroughly saturate the balls before planting; the soil in the beds, also, if at all dry, should be well soaked some hours before being planted.

SUBTROPICAL PLANTS.—It is quite safe now to plant subtropicals of all sorts, and do not forget that where, as in the case of such plants as the various sorts of *Kleinia*, *Wigandia*, *Carduus*, and others, a large development of foliage is principally required, there must be an abundance of stimulating matter at the roots, so that in addition to the manure recommended to be trenched into the beds, and if the drainage is good, such stimulation may be very economically applied in a liquid state when the foliage indicates that roots are becoming abundant; and in the case of gross feeders even strong sewage carefully applied is not too much, but generally speaking the drainage from stable manure with a little guano stirred in occasionally may be deemed sufficient for the purpose and the most cleanly. In any case most of the

sorts will pay for stimulation at the roots during growth. I would specify the different coloured Beta cica, which is very striking when well grown; the Pampas-grass, too, revels in liquid-manure, and throws up very fine heads of flower; indeed, the judicious application of it forms the secret of many striking forms of vegetation.

PLEASURE GROUNDS.—The late genial rains, however good for vegetation generally, have greatly added to the amount of labour required in the garden at this already busy season. Grass grows incessantly and the labour of mowing, edging, and rolling both grass and gravel is greatly increased but must be attended to; weeds also grow apace, but being so busy bedding-out we can only threaten them. They are fortunate who can spare a hand or two to pass over the beds and borders requiring it with a light hoe; this indeed will soon become an imperative necessity to prepare such beds and borders for the reception of the various sorts of annuals, such as *Asters*, *Marigolds*, *Zinnias*, *Heli-chrysum*, *Nasturtium* and a host of others the planting of which will require to be immediately carried out as soon as the work of bedding-out is completed, and if they have been carefully pricked out as recommended they will scarcely miss their moving and should grow away at once.

SONG BIENNIALS.—The seeds of biennials, such as *Canterbury Bells*, *Brompton Stocks*, *Rose Campion*, *German* and other *Wallflowers*, *Sweet Williams*, as well as perennials, may now be sown. I should recommend them to be sown rather thinly in drills on a sheltered border, so as not to become drawn and to be eligible to be planted direct from the seed-bed to the borders in the autumn.

ROSE GARDEN.—This is now coming on to pay for good cultivation, and must be assisted with periodical applications of good liquid-manure, say, once a week at least, with plenty of soft-water in the intervals if dry weather prevails, always premising that the drainage is good enough to allow of the surplus water percolating away before becoming stagnant, for although *Roses* like a strong holding soil, stagnant water about the roots is very injurious. It is still necessary to wage incessant war against the weevil, that eats into the buds if left alone. *John Cox, Redleaf.*

The Pine Stove.

If loam has not been stored for summer and autumn use it should be done without delay. As good loam is indispensable, and in many cases not easily procured, any plan that will meet this want is welcome. To keep up a supply of good loam, year after year, means taking it away from good pasture-land or parks, and this loss must be made up by some practical, well devised, compensating system, to make the part good where the loam is taken away, by a well-balanced arrangement—for if this deficit should go on for some years it will soon impoverish a large area of land, which few proprietors could be expected to sanction. When allowed to select loams every endeavour should be made to make the loss good in the shortest time possible. When building, or alterations are going on, and the soil is to be disposed of, these conditions should be taken advantage of; but these contingencies cannot always be relied upon. When these means become exhausted, the only alternative is to go to the meadows or park. When turf is cut from these places it can only be cut two ways—one is to cut the turf all from one place, or, in the second, to cut it over in furrows. We prefer the latter mode, for in that case the broken ground can be made good in the shortest time. A plough is used to take out the furrows, which are 10 inches wide, and the depth is varied from 1 to 2 inches, according to the quality of the soil. This assists hand labour and saves time. In filling the furrows let the soil be a little higher than the sides, this allows for sinking, and in a short time the roots from the sides soon run through the new soil, making the whole green again. This way entails a little more labour than cutting all from one place, but it has many advantages. As the fresh cut loam is taken into the garden, the same team takes back rich manured soil from the garden to fill up the furrows. When the fruit borders are renewed in the houses, the soil, which contains unexhausted bone, lime-rubbish, charcoal, and soil that has lost its vegetable fibre is put in the outside fruit

tree borders, and the natural soil from the fruit-borders or wall-trees is taken to fill up the furrows where the loam is cut. Although this system takes time in doing, yet it is so gradual—a little every year—that the extra trouble and strain is not felt, and it forms a plan of making good and permanent wall-tree borders outside. When the soil is all taken from one place the same quantity of fresh soil as turf taken away should be spread over the ground: this makes up for the loss of the turf; the soil should be worked and made level, then sown with good quality grass seeds. After this is done the ground should be fenced round to keep the cattle from treading or disturbing the grass seeds before they are well germinated, as well as to give the ground sufficient time to become consolidated, and thereby allow the new grass or turf to establish itself. The soil should be packed in a dry shed only for a stated time before using, for if allowed to lie too long the vegetable fibre becomes too much decomposed, which means losing its highest virtue. The cultural directions given in recent *Calendars* still apply for the present. Succession plants, should be encouraged and watched in every detail of management, as the present is the time when the sinews and the backbone of next year's fruiting plants are formed. Where the planting-out system is carried out, it should be done at once, but this will form the subject of my next *Calendar*. *D. Wilson, Castle Hill, Devon.*

The Hardy Fruit Garden.

APRICOTS which were thinned last month are now advancing in growth rapidly. As the fruits swell it will be necessary to see that the roots do not lack a plentiful supply of water should the rainfall prove insufficient; if there be any neglect in this particular the commendable practice of shallow planting and occasional relifing will prove of no advantage through neglect of an essential operation. Examine the shoots frequently for evidence of the maggot that is so troublesome amongst *Apricot* shoots, and keep in check by pinching and frequent application of water. If there is the very convenient appliance of hydrants, and the water can be used with force from the hose, there is no great trouble in keeping trees clean after the weather becomes sufficiently mild to admit of the use of unwarmed water; but early in the year such application often proves too cold for the immature and tender foliage. The disbanding of *Peaches* and *Nectarines* on walls ought now to be completed, and the work of thinning the fruits be also correspondingly advanced. Where the set has been fairly regular over the trees, and the crop heavy, remove in this thinning all fruits at all under-sized, and any that are placed too near to any nails and are likely to require the removal of the latter when the fruits swell. It is not well to leave more fruits than it is considered expedient for the tree to carry to perfection to provide for possible loss during the stoning process, for all fruits left beyond the sustaining powers of the tree only help to induce the result they are intended to relieve. Vigorous and leading shoots will now require to be kept nailed-in, fastening in closely with matting the heels of any shoots that do not start properly in the required direction. It will be well to use only tepid water on *Peaches* until the water in the various reservoirs and pools becomes sufficiently warmed by the hotter weather we may now expect to experience, and on any re-appearance of greenfly use an insecticide—soft-soap being yet perhaps one of the most useful, and certainly the cheapest. See that the roots, in common with those of all fruit trees on walls with a southern exposure, be frequently supplied with water. Let all alleys in front of fruit walls be deeply stirred with the hoe to prevent cracking and evaporation, and if a dressing of long litter has not yet been applied to such positions it will be advisable to attend to such work without delay. Use fresh stable-manure where procurable, putting it on of a sufficient thickness to resist the wear of treading upon it for some months, and see that all suckers are carefully removed as the operation is proceeded with. The breastwood of *Plums* and *Cherries* is now advancing rapidly, and will demand speedy attention. Finch-in closely all gross shoots, and retain unpinched those short ones that give evidence of forming natural spurs. The black aphid will now speedily put in its appearance, and it will be necessary to see that it be not

allowed to establish itself on *Cherry* trees. Use an insecticide immediately upon its appearance, and this will most probably have to be repeated before a perfect clearance can be made of this persistent insect. The shoots of *Vines* on walls can now be pinched-in to a couple of leaves beyond the bunches, which will now be showing themselves, and all growth can be regularly arranged and secured in their places. Any shoots that were left at the previous disbanding, and which are not wanted, should be at once removed, taking care to preserve those selected for replacing old canes or for extensions, and see that they are properly tied in as they advance in growth. Continue to look out for the depredations of the *Gooseberry* caterpillars, and destroy these grubs in their early stages, before they have time to injure the bushes *R. Croutin, Castle Gardens, St. Fagan's.*

Grapes and Vineries.

THE earliest vinery where the *Grapes* are ripe or cut, can now have the fire-heat dispensed with if the wood is hard and well ripened, but if not, continue to use a little fire-heat in the daytime, with an abundance of air. Do not let them get dry at the roots, but keep the atmosphere drier. Succession *Hamburghs* that are colouring can be kept at a night temperature of 65° to 68°, with a rise of 10° by day; keep the evaporating pans dry, and do the damping down in the early part of the day, so that it will dry up before evening. Give air on both back and front ventilators, and do not close the back ventilators. After the *Grapes* commence to colour, turn extra heat on early in the day, and increase the air as the temperature rises, taking care to avoid cold draughts, for on cold or windy days much less air will be required. Water the inside border with clear tepid water when necessary, in the early part of the day; those that are swelling their fruit must have liberal supplies of tepid manure or guano water, taking care to give sufficient to go through the border, which, if very hard, must be loosened up with a fork. Close the house early in the afternoon, letting the thermometer run up to 90° after closing time, then very little fire will be required through the night, and in the morning the foliage will be laden with dew. Turn on the heat early in the day, and force in the daytime. On bright days the fire-heat can be turned off when the pipes are once well warmed. The latest house will soon be in flower, and will be better for a little fire-heat at that time to make the atmosphere light and buoyant. Give the inside border a good soaking of clear tepid water before they come in flower; tap the rods several times daily to disperse the pollen, and when thinning commences they will want more berries taken out than is generally done, with *Hamburghs*, for I find, if not severely thinned, they damp very much in the centre of the bunch through the month of November. I find, when thinned like *Alicantes*, they keep very well until the new year, and are much preferred at table to any other black *Grapes* at that time. Early *Muscats* that are changing colour must be kept at the temperature advised in last *Calendar*, keeping the atmosphere a little drier, and giving rather more air, but this requires to be given with great care, or shanking will follow if they get cold draughts or a check of any kind. When the borders are dry clear tepid water will be best. Those later that are swelling their fruit must have liberal treatment, for if the borders are well drained they will take an immense amount of tepid manure-water, say, about once a fortnight, but of course that depends on the weather being dull or bright. Keep the evaporating pans filled with weak manure-water, and close the house at 90° to 95° with bright sunshine and plenty of atmospheric moisture. It is a good plan now to always put a little back air on early in the morning, as then the confined moisture can escape, and there will be no burnt foliage. Late varieties of *Grapes* for keeping through the winter will now be thinned, but would be better looked over with the scissors again, taking out any cross berries that are left, as they require thinning with great care, so that the berries will not be crowded, and yet the bunches compact. Give liberal supplies of manure-water when required, and keep the temperature as advised in last *Calendar*. Newly planted vineries must have liberal treatment to induce a good early growth, giving plenty of heat and air in the daytime, and closing early in the afternoon, with abundance of atmospheric moisture. The earliest *Vines* from eyes will now be about the required length, and can be stopped, and the laterals or side shoots be stopped at the first joint, give air early in the day, for if the large leaves scold they never do so well the following year. *Joshua Atkins, Locking Gardens, Wantage.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	June 5	Sale of Imported and Established Orchids, at the Mart, by Proffers & Morris.
TUESDAY,	June 6	Sale of Bedding and Greenhouse Plants, at F. & A. Smith's, Dulwich, by Proffers & Morris.
THURSDAY,	June 8	Sale of Imported and Flowering Orchids, at Stevens' Rooms.

GREAT men lived before AGAMEMNON, we are told, and it is certain that great men have lived after him. DARWIN, assuredly the most modest and diffident of naturalists, certainly never laid claim to be the exclusive originator of those notions of gradual evolution and progressive development of species, by the amplification and application of which during the last quarter of a century he has so entirely changed the current of ideas in natural history. His indebtedness to the gardeners and botanists we have from time to time pointed out, and he himself, ever anxious to honour others rather than himself, made more than ample acknowledgment. It was not for him to appropriate other people's ideas or hush up their materials without permission or acknowledgment into the semblance of original work. But when the tide began to turn in favour of DARWIN'S views people began to say, as they generally do in such cases, that there was nothing new in them—they began to remember what somebody else had said years before, and authors who had given to the world similar ideas, which had fallen flat, remembered their earlier efforts, and were proud to see the notions they had advanced in vain become, as it were, the foundations of a great theory. It was so with our old correspondent, PATRICK MATTHEW, who recognised the principle of natural selection as far back as 1831, and whose article in our columns, 1860, p. 312, it is most instructive to read, not only from its direct bearing on the great principles of adaptation and natural selection, but for its practical lessons in the selection and culture of timber trees.

It is needless for us now to give further instances of this, or to point out why the scattered hints and comparatively isolated, unsupported notions of others failed to find acceptance, while in the hands of a DARWIN the self-same or very similar notions welded into a consistent whole have compelled general assent among naturalists. Our object at present is to make mention of an evolutionist who dates back even beyond LAMARCK—in fact, to the year 1766. A hundred years ago—twenty-five years ago—the generally accepted belief (apart from such scanty exceptions as we have mentioned) among naturalists, was, that species were immutable. They might vary within certain limits. No one knew what or where those limits were; it was only seen that what was true for one species was not necessarily so for another; in the one the range of variation, the limit, was very wide, in the other it was very restricted. Plants and animals had existed—there were incontrovertible proofs of it—in the former ages of the world's history, but they were not looked on as possibly, and sometimes certainly, the direct progenitors of existing species. Indeed, not so very long ago such fossilised plants or animals were supposed, like the hills and valleys, like the strata in which the fossils are embedded, to have been created just as we now see them, and where we now see them, for some inscrutable reason. The ideas of continuity, of lineal descent, of family characteristics handed down from ancestor to offspring, of variation according to circumstances, resulting in the gradual creation of new forms, of the struggle for life, the survival of the fittest best fitted to contend and hold their own in the universal competition, and such-like notions, if they existed at all, were only partially and separately recognised. The concurrent action of all these causes, the one modifying and controlling the other, was not perceived.

Assuredly if there is one class of men to whom the variation of species and the variation perpetuated and enhanced by continuous selection, comes home, more than another, it is to the gardener and the raiser of new varieties. As we have seen, some of the gardeners of old did recognise the truth, but did not push it home to its legitimate consequences. PATRICK MATTHEW'S views are, to a considerable extent, couched in the same language as DARWIN'S. Dean HERBERT, a man of great knowledge and much practical skill and experience in hybridisation, declared that species were only permanent varieties, and he went further and stated that by variation and intercrossing of older species all our existing ones have been produced. NAUDIN, working with similar materials, and with the same object, came to similar conclusions. M. ALPHONSE DE CANDOLLE reminds us, in a brochure which he has had the goodness to send us, of yet another. DUCHESNE, whose history of Strawberries, dated in 1766, is known to all pomologists who take interest in the history of their art, found on sowing a number of seeds of the wild Strawberry that the greater part of the seedlings presented leaves with a single leaflet instead of three as usual. He sowed seed again from these one-leaved Strawberries with the same result, and he based upon these facts some remarks as to the filiation and genealogy of species and varieties. The genealogical arrangement, said he, is the only one indicated by Nature—the only one which is satisfactory to the mind; every other is arbitrary and void of ideas.

True, this was written after RAY and BERNARD DE JUSSEU had hinted at the natural system, after LINNÆUS had suggested that individual plants or groups of plants had relations one to the other, even as a country has relations with those which abut upon it in various directions. But although written after these forerunners of the natural system, it was published nearly thirty years before ANTOINE DE JUSSEU laid the foundations of the natural system as we now recognise it; and those who remember the very remarkable thirteenth chapter of the *Origin of Species*, wherein DARWIN lays down so clearly what is the real underlying basis of natural classification—namely, the genealogical descent of organisms, the offspring inheriting some of the characteristics of their predecessors, not, indeed, exactly reproducing them, but varying in some degree from them in obedience to circumstances—will feel that DUCHESNE had, indeed, grasped the same idea. Indeed, he even constructed a genealogical tree for the Strawberry, as CARRIÈRE long afterwards did for the Peach. It is a favourite occupation now-a-days for transcendental botanists to construct such trees, like the Greek trees of our school days. In too many cases, however, the basis of fact is too small for the superstructure of speculation, the known is in far too slight proportion to the unknown, still the principle is right; it is only a case of attempting to run before even walking is safe. In the case of horticultural products, such as the more modern races of Pelargoniums, Begonias, and the like, such "trees" may be constructed with little difficulty, because the history is known from the beginning. It should be the aim of the thoughtful horticulturist to construct such a document now, before the memory of these first beginnings gets lost in the multiplicity and confusion of new developments. It would not only be interesting to the man of science, but valuable to the raiser, as showing in what direction progressive improvement may most probably be found, and what circumstances tend to stagnation and retrogression.

— THE BAGSHOT RHODODENDRONS. — We understand the exhibition of Rhododendrons by Messrs. JOHN WALKER & SONS, of Bagshot, Surrey, will again be held in the gardens of Cadogan Place,

Sloane Street. The plants have already been arranged, and a very varied and grand display is expected. The exhibition will be on view from June 5 and throughout the month.

— PICEA POLITA. — We have on a former occasion given the history and description of this noble Japanese Spruce, together with an illustration. We advert to it again because in Messrs. VEITCH'S nurseries at Combe Wood a variety has shown itself in which the erect cones are purple in colour. In the specimen before us the leaves of the purple-coned form are shorter and stouter than in the other, but whether this is any more than an accidental coincidence we have no means of knowing. In any case it is a grand Spruce, and perfectly hardy.

— MR. ISAAC DELL. — MR. DELL'S many gardening friends will regret to hear that, owing to a reduction of the establishment, he is leaving Stoke Rochford, where for twenty-five years he has been gardener, and for the last twelve years forester as well, to CHRISTOPHER TURNOR, Esq. MR. DELL, who raised the well-known Beet which bears his name, was also the first to introduce carpet bedding and raised beds into that part of Lincolnshire, and of the quality of these our readers have some knowledge through the illustrations published in our columns early in 1879. He has credentials of the highest order, and with his great experience should have no difficulty in meeting with another appointment as gardener, bailiff, or forester.

— THE LONDON AGRICULTURAL SEED TRADE ASSOCIATION held their second annual dinner, in the Freemasons' Tavern, on the evening of the 22d inst., when WILLIAM NEUSDETEL, Esq., in the absence of the President, JOHN PICARD, Esq., took the chair, the Vice-Presidents being NATHANIEL SHERWOOD, Esq., of Messrs. HURST & SON, and DAVID SYME, Esq., of the Lawson Seed and Nursery Company, Edinburgh. The usual loyal and patriotic toasts having been drunk, the toast of the evening—that of "The Association"—was proposed in able terms by the Chairman, who spoke mainly upon the object, utility, and success of the same. During the evening a variety of toasts were proposed, comprising "The Agricultural Interests of the Country," by MR. SYME, and "The Visitors," by MR. SHERWOOD.

— THE BANK HOLIDAY. — On Monday the number of visitors to Kew Gardens amounted to the extraordinary total of 95,000. The Royal Horticultural Society's Garden at South Kensington was visited by 11,150 persons, who paid *z*d. each, and thus placed over £50 to the credit of the Society.

— ANTHURIUM ANDREANUM. — This plant, like the well-known *A. Scherzerianum*, evidently differs much in the character of the flowers, especially in the dimensions of the spathe, which in some plants attain so much greater size than in others as to make the large-flowered forms of much the most value. In one of MR. BULL'S houses, amongst a number of big-flowered forms is one, the largest we have seen. It is more than likely that in none of the examples that have bloomed have the flowers attained near the size they yet will do; in the case of *A. Scherzerianum* the strongest plants were six or eight years before they produced flowers that reached their full size. But even in its present condition *A. Andreanum* is most telling—the glossy, brilliant scarlet spathe set off with the white and yellow spadix, constitute it one of the most striking, as well as singular, of flowering plants.

— RHODODENDRON COUNTESS OF DEVON. — This is a charming variety for the American garden, and is admirably adapted for placing out singly as an isolated specimen. It is especially valuable because of its distinct colour, and it is rendered still more conspicuous if it is planted in view of some of the bright red colours which are so common and of so many shades among Rhododendrons. The colour of the Countess is lilac, with a tinge of pink and dark maroon spots.

— CRAIG-Y-NOS CASTLE: A DISCLAIMER. — Messrs. WILLIAM BARRON & SON, Elvaston, Borrowash, request us to state that they are neither related to, nor connected with, the firm employed by Madame PATTI to lay out the grounds at Craig-y-nos.

FIG. 115.—HOYA GLOBULOSA: FLOWERS CREAM COLOURED. (SEE P. 732.)

— GENEVA.—The Horticultural Society of this city will hold an exhibition from September 7 to 11 inclusive. Foreign exhibitors are invited to compete.

— Mr. JAMES JENK, from the nurseries of Messrs. DOWNIE & LAIRD, has taken on lease the nursery of the late Mr. JOHN REID, at Appley Bridge, near Wigan.

— DIOSMA FRAGRANS.—If it were but known how valuable many of our old-fashioned plants are and how useful some of them are for providing material to meet the requirements of the present day a great many more of them would be grown. The plant in question will succeed under very ordinary cultivation, and a few sprays of it are always acceptable among cut flowers. The flowers are insignificant, but fragrance is so much appreciated that it is always handy to know where to go for a few sprays to spice up a bouquet for the dinner-table or sitting-room.

— POTATO FREIGHTS.—The *Guernsey Advertiser* states that the South-Western and Great-Western Railway Companies have decided to reduce their Potato freights from 32s. to 25s. per ton, commencing from June 1.

— THE GHENT SCHOOL OF HORTICULTURE.—Some representatives of this Institution, of the Cercle d'Arboriculture, and other horticultural establishments of Ghent, propose to visit this country at the end of this month. A week is to be devoted to the inspection of representative establishments in all departments of horticulture near London. Under the auspices of a committee appointed by the Royal Horticultural Society a programme is in course of arrangement, which will, it is hoped, allow our visitors to see as much as can be done in the time, and afford English horticulturists some slight opportunity of reciprocating the warm hospitality always lavished upon them at their visits to Ghent. Communications on the subject should be addressed to Dr. MASTERS, Foreign Secretary to the Royal Horticultural Society, South Kensington.

— A DOUBLE WHITE LAPAGERIA.—In September last Mr. DUFFIELD, gardener to H. K. MAYOR, Esq., Bamford Lodge, Winchmore Hill, sent us a flower of a perfectly double *Lapageria rosea*, which we illustrated at p. 441, vol. xvi., and has now favoured us with a double flower of *L. alba*—a large handsome bloom, with a double row of segments, and which we hope shortly to portray.

— TROPÆOLUM MAJUS GRANDIFLORUM.—This is a true amateur's plant, and an undoubted acquisition in its class. Handsome little plants may be grown in a few months from the cuttings. Finch once after the cutting is well rooted, in order to get from three to four breaks. Put a stick to each growth, and you have a dainty little plant which will attract no end of admirers. The flowers are yellowish-orange, with dark spots shading to crimson; and by using slender twigs for supports, brought to the shape of a cone at the point, you make a very elegant little plant for an amateur's greenhouse, or for a sitting-room on a pinch.

— ECONOMICAL MELON GROWING.—In this busy and competitive age, when the most must be made of everything, and especially of glasshouses, one cannot help admiring the ingenuity of the craft and the various devices adopted by them in order to get the greatest quantity of produce from the smallest given space. A notable example may be mentioned in the system of Melon growing which is practised by Mr. HARPER, gr. to Sir LYDSTONE NEWMAN, Bart., Mambhead House, Kenton, Devon, where a splendid crop of Melons is growing in the Pine-stove without the loss of a foot of space to the latter. Melons are often grown at the lack of a Pine-pit, or Cucumbers grown in pots, plunged in the bed, and trained up pillars, are frequently seen, but Mr. HARPER's plan exceeds in ingenuity any of these schemes. The Melons are planted in a narrow border at one end of the Pine-pit, not more than a foot in width, and trained over the path. The trellis is formed of two long sticks running parallel with the end of the house, and to these smaller pieces are fastened obliquely, to which the Melon plants are trained. There is not a single Pine plant less in the pit because the Melons being planted there, and the space they occupy over-

head is, of course, no loss to the Pines whatever, while the gain as regards results is considerable. Where people are rather hampered for room this is an excellent and convenient way of obtaining an early supply of Melons, if it is not a plan worthy of general adoption.

— MUSHROOMS.—In the current issue of *Science for All*, Mr. W. G. SMITH has written an illustrated article on Mushrooms, giving full particulars of the different varieties of true and false pasture Mushrooms, their characters, qualities, points of structure, &c. As we are frequently asked to give information about Mushrooms, we advise such of our readers as are interested in the nature of these curious esculents to refer to Mr. SMITH's paper, where all that is known about them is given in an understandable form.

— BALSAMS FOR AMATEURS.—The display that may be made by cultivating a good collection of these lovely summer-flowering plants should commend them to the notice of amateurs, who above all others take a pride and interest in watching the growth and development of plants. Slow growing plants, of which there are many, do not give sufficient stimulus or encouragement to beginners in plant growing; nor are they always attainable. But plants that may be raised from seeds and grown 3 feet in diameter in as many months cannot be called expensive or bad to grow. An amateur having a three-light frame in which there is sufficient heat to excite the seeds into growth may grow plants to the highest degree of perfection. Put the plants first of all, as soon as they have made two leaves, into thumb-pots, and plunge them again in the bed until they have taken root afresh, which will be in the course of two or three days. The plants should be kept quite close to the glass, and immediately root-action appears to have recommenced give a little air both night and day—more, of course, through the day. At the next potting the plants should be kept low in the pots in order to get the base shoots about level with the top of the pot. This is really the only point in Balsam growing that requires skill and attention, for it is quite as easy afterwards to grow a plant a yard across as it is to grow it a foot. But perhaps medium-sized plants are most useful after all, and these are secured by flowering the plants in 48-sized pots. A good succession may be kept up for a season from a single packet of seeds, and any plants that do not promise to make handsome pot plants will not look amiss in a mixed bed in the flower garden.

— WHITE ARUMS AS AQUATICS.—It would be hard to name any other plant in cultivation that occupies a more prominent place in gardens, or that can be turned to such good account in so many ways that are at once both profitable and useful, as those free-growing Arums called Callas or Richardias. From early in November until after Easter they are in great demand for various purposes of decoration, but chiefly for the embellishment of conservatories and for house furnishing and church decoration; for the latter purpose they are *par excellence* the rage of the day. But the object of these remarks is to point out their utility as aquatics. In the Exeter nursery of Messrs. LUCOMBE, PINCE & CO., they have a finer effect in the Lily pond, where they have for their companion the beautiful Water Lily, *Nymphaea alba*. Groups of them put into the Lily pond three years ago have increased rapidly, proving satisfactorily that, common as the plant is, it may be made more common still as regards extending its cultivation. The pond is margined by rocks, among which a goodly variety of hardy Ferns are planted, but still the Arums, from the boldness and substance of their leaves, will attract attention when plants that are more costly remain unnoticed.

— GRAND FLOWER SHOW AT PARIS.—This show, which closed on May 30, proved one of the most successful ever held by the Société d'Horticulture de France, though, unlike last year, there was no special attraction. It took place in the Champs Elysées, between the Palais de l'Industrie and the River Seine in the Pavillon de la Ville de Paris, which stood in the centre of the International Exhibition of 1878. All round the building a nice garden was arranged, and a lofty tent for the plants. The arrangements of the garden, inside and outside, were in the hands of M. ANDRÉ. Of course, the most attractive part was the garden inside the pavilion, which had at the furthest end a

mount surrounded by M. CHANTIN's large Palms, from which a good view was obtained over every part. Mr. JIARRY J. VEITCH, of London, was named as President of the jury, which also included M. ED. PYNARET, of Ghent. On the judging day a banquet, presided over by M. LEON SAY, Minister of the Exchequer, was held in the rooms of the Society, Rue de Grenelle, Paris, at which several speeches were made, including one by our countryman, Mr. VEITCH. First among the more noteworthy objects of the exhibition were the large Palms of M. CHANTIN, who received the Grand Prix d'Honneur, and all of which were in good order and the best of health. Not far from this group was M. SAISON-LIERVAL, nurseryman, of Paris, who had a *Médaillé d'Honneur* for a good lot of Palms, stove plants, &c., amongst which we noticed *Anthurium Warocqueanum*, regale, crystallinum, and *Dracena Godeana*. In front of the Palm-mount was a small piece of water, surrounded by fine groups of *Rhododendrons*, *Azaleas*, &c., belonging to M. MOSER, of Versailles. This gentleman having last year gained the Grand Prix d'Honneur, did not on this occasion show for competition. MM. CROUX et FILS, Vallée d'Aulnay, near Sceaux, had a good lot of plants, for which they were awarded a Medal of Honour; they had staged them as an embankment against the wall, and their *Kalmia latifolia*, *myrtifolia*, *Rhododendrons*, *Azalea caucasica*, all well bloomed, looked very attractive. The same firm exhibited outside a fine group of *Acer Negundo* polymorphum, and others, Purple Beech, and *Weigela nana variegata*. One of the most attractive groups was that of MM. CHANTRIER FRÈRES, of Montfontaine, who received a Gold Medal for a grand lot of Crotons, their own seedlings, and stove plants. Their Crotons were perfect, as far as culture goes, amongst the best of them being *Baronne James de Rothschild*, *Bergmanni*—these two are most valuable for furnishing, lasting a considerable time indoors; *Chantrieri*, *Mortfontainensis*, very fine; *Baron Sellière*, *Tranfautii*, musaicus, very good; *Drouetii*, *latimaculatus*, a new variety, *Princesse Mathilde*, with large yellow leaves, spotted with green, very curious. Amongst the stove plants *Anthurium Andraeanum*, *Dracena Lindenii*, *Aralia Chabrieri*, very graceful; *Alcaocia Thibautiana*, and other good lots were rewarded by a Gold Medal to each one—to M. DUVAL, of Versailles, for a striking collection of well-flowered Gloxinias; and the other to M. BLEU, the well-known Caladium raiser, who showed some good plants, well coloured, also some good Begonias and a few Orchids. M. ALBERT TRAUFAUT, of Versailles, had a Gold Medal for a fine group of sundry stove plants, including *Dracenas*, *Bromelias*, &c., *Anthurium crystallinum*, *Dracena Godeana*, *Lindenii*, *Anthurium Andraeanum*, &c. M. ROY, 164, Avenue d'Italie, Paris, contributed a good variety of *Clematises*, well grown and well flowered. The Jardin du Luxembourg also exhibited, not for competition, a collection of *Bromelias*, and a few large pans of *Cypripediums*, well flowered. Two nurserymen only showed Orchids—MM. THIBAUT et KETELEER, of Sceaux, and M. LÜDDEMANN, of Paris, and each firm received a Gold Medal. The collection of M. LÜDDEMANN comprised the following:—*Oncidium concolor*, *Vanda tricolor*, *Cattleya Skinneri*, *C. Acklandiae*; *Masdevallia ignea*, *M. Harryana*; *Saccobolium curvifolium*, *Burlingtonia venusta*, *Trichopilia crispata*, *Anguloa Clowesii*, *Laelia purpurata*, *Cypripedium Hookeri*; *C. villosum*, &c. In the lot of MM. THIBAUT we noticed *Cattleya Mossie*, *C. Warneri*; *Oncidium concolor*, *Odontoglossum Roelzii*, *O. Pescatorei*, *O. cirrosum*, *O. prænites*, *O. vexillarium*; *Cypripedium Boxalli*, *C. Lawrenceanum*, *C. villosum*; *A. rides japonicum*, *Epidendrum vitellinum majus*, *Cymbidium Lowianum*, *Ada aurantiaca*, &c. The same firm showed also a nice lot of *Pelargoniums*, well flowered. Facing the entrance, MM. COUTURIER et ROBERT had a very fine group of seedling tuber Begonias, which were very good, and were awarded a Gold Medal. MM. LÉVEQUE et FILS had, not for competition, a fine bank of Roses, well flowered, and also cut Roses. M. POIRIER, of Versailles, took a Silver-gilt Medal for *Pelargoniums*. MM. L. DALÉ took a Medal of Honour; LANGE, Gold Medal; and SAVOYE, Gold Medal, for sundry groups of Palms, *Dracenas*, &c., especially plants most suitable for furnishing. We should also notice two very finely grown plants of the very graceful green *Dracena Boerhavi*, shown by M. CHEVET,

to whom was given a Silver Medal. In the tent separated from the large pavilion was a fine group of large and medium-sized specimen Roses grown in the English way by M. J. MARGOTTIN FILS, of Bourg-la-Reine. This was rewarded by a Medal of Honour. What appeared to us the best was a grand specimen of La France, well grown and covered with flowers. Amongst the other Roses we saw Captain Christy, Adam, Madame de St. Joseph, Caroline Kuster, Dr. Andry, Annie Laxton, Comtesse d'Oxford, Anna Alexieff, Madame Scipion Cochet; the same firm showed also standard Roses and forced pot Vines well fruited. M. MILLET had a Silver-gilt Medal for forced Cherries and Grapes of very fair quality. M. CONSTANT LEMOINE, of Angers, had a fine group of seedling Dracaenas, which took a Silver-gilt Medal: some of the varieties were very striking. The Asparagus growers of Argenteuil showed some monstrous Asparagus, also Strawberries. The show of horticultural implements was very complete. We believe this show will pay its expenses, which is seldom the case in France. We understand also that the Ville de Paris may in future be induced to lend this pavilion every year for the large show, which would be a great advantage to the Society.

— WHERE TO PLACE GARDEN SEATS. — It must have occurred to a great many people who have the opportunity of visiting private grounds that garden seats are not always found where they ought to be. It does not require the eye of an artist to select a proper situation for a garden seat, or seats, but it does require some little judgment, and an eye that is ready at detecting a pretty peep or a commanding view, to place garden seats where those who rest may fully enjoy whatever beauties the landscape affords. If you find a seat under a spreading tree placed there apparently for no better reason than that the tree has big branches to shade you from the sun, then that seat is not in its proper place. At a venture one might risk the opinion that there is not a garden in the country where there are not many beautiful views as there are seats, and still the said seats are found to be placed at random. A seat should, of course, be placed where there is partial shade, at least sufficient to insure a proper degree of personal comfort, but it should also be placed where the eye would be led to roam over the sweetest portion of the landscape, to catch a peep of the sea, or river, or lake, or be directed by well-defined boundaries through vistas of trees to some conspicuous object in the distance—a rising hill, a fertile valley, or descending to more commanding objects, a group or border of flowering shrubs, or even a handsome specimen of the mountain Ash, which is now in flower, and, though less fragrant than the Hawthorn, does not lack effect in a well chosen situation.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 29, issued by the Meteorological Office, London:—The weather has been generally rather cloudy and unsteady, with several thunderstorms and frequent showers. Towards the latter part of the period, however, the sky became much clearer. The temperature has been about equal to the mean in "England, S.W.," but elsewhere it was below the average, the excess varying from 1° in Ireland to 4° in "Scotland, E." The thermometer was highest at several stations in the west of England on the 23d, but over south-eastern England the maxima were registered on the 26th or 29th, and were as high as 73° at Hillington, Goldstone, and in London. The minima ranged from 37° in "Ireland, N.," to 46° in "England, E." The rainfall has been a little less than the mean in "Scotland, E.," but more in all other districts. Over central and south-western England, and in the south of Ireland, the excess was rather large. Bright sunshine shows a considerable decrease in duration from that reported last week, the percentages ranging from 37 in "England, S.W.," to 57 in "England, N.E.," and 60 in "Scotland, E." Depressions observed.—During the greater part of this period the barometer has been highest over France, while several shallow depressions have travelled in an easterly direction over our north-western coasts. The wind has consequently been generally moderate from the south-westward, but on the 27th a slight gale or strong breeze was experienced on all but our extreme south-east coasts. At the close of the period the area of high pressure had moved northwards, and an anti-cyclone had been formed over southern England, the Channel, and the north of France.

— GARDENING APPOINTMENTS.—Mr. JOHN MCKENZIE, Gardener, Riddlesworth Hall, Thetford, Norfolk, is engaged to succeed Mr. GROOM, who leaves Linton Park, Maidstone, in August.

LUSCOMBE CASTLE.

THIS picturesque and charmingly situated country seat (see p. 745) is the property of P. M. Hoare, Esq., and is situated about a mile and a half from Dawlish, admittedly the most pleasant sea-side resort on the south Devon coast. Dawlish lies between Exeter and Torquay, on the Great Western Railway line, which for several miles runs close by the beach through short tunnels in the rocks, where the iron horse is lost to view, and again appears dashing along by the brink of the sea—a pleasing sight to strangers unaccustomed to such a scene, and exhilarating to passengers, who quaff the pure air and are fanned by the genial breeze, which is seldom absent from this lovely coast. Dawlish, apart from local attractions, enjoys the reputation of possessing the most equable temperature upon the south Devon coast. Its natural position at once suggests the idea, lying as it does in a "cove" bounded by Langstone Cliff on the north, and the Parson and Clerk Rocks on the south—the town is so sheltered that anything like extreme variations of temperature are almost unknown. The town may be said to be divided by a clear running rivulet, by the margin of which is a public ground called "The Lawn," the luxuriance of which is always pleasing to visitors. The trees and shrubs are kept in good order, and as conveying an idea of the marvellous gentility of the climate, it may be mentioned that such plants as *Cytisus racemosus*, and *Chrysanthemum fruticosum*, not only live, but flower more or less all through the winter. Of the latter, bushes may now be seen over 4 feet across, and quite a sheet of bloom.

The parish church is passed on the way to Luscombe, and is about half a mile west of the town. There are six entrances to the demesne, and something like seven miles must be traversed in order to circumscribe the plantations. First of all let me notice the various attractions of the woods and plantations, which are wonderfully picturesque and romantic. A long walk takes the visitor to Summercombe, a favourite spot, where picnic parties are held, in or close by a rustic summer-house, and sportsmen enjoy their luncheon at shooting parties in winter. Whether you walk or drive to this beautiful spot, much pleasure and enjoyment will be afforded to those who seek to find it, in trees forming a canopy of foliage overhead, or wild flowers in great numbers, or native Ferns established by the brink of a trickling stream several hundreds of feet below the drive. Rhododendrons are now adorned in gay attire of various colours in the woods, and these will be succeeded by Foxgloves, and Nature has margined the pathway with a dense carpet of Ivies, which looks fresh and green all the year round. At present the ground is covered with wild Strawberries in flower, Primroses, Veronicas, and wild Hyacinths. At the back of the summer-house is a fine cider orchard, which runs in an opposite direction for nearly half-a-mile. But continuing a survey of the woods, the fish-pond is the next object that attracts the stranger, until an open space is reached called the "brakes," an extensive tract of moorland country stretching away towards the sea coast. And then it suddenly flashes across the mind of the visitor, that Devonshire is proverbially the most romantic and picturesque county in England, and that variety of scenery is its acknowledged characteristic—that hills and dales, mountains and moorland, woods and forests, are strangely mixed up, presenting a huge panorama to the eye of a stranger.

But there is not much time for meditation, and so I proceed hurriedly until a lodge is in view which is draped with creepers, and hardy Fuchsias are flowering upon a bank facing the door. The gate is opened, and lo! I am once more upon the parish road between Dawlish and Teignmouth. "There," said my guide, "is the terrace before you; you can please yourself, sir, but if you go a little way higher up you will have one of the best views of the country to be seen anywhere about here." And so I did, and was rewarded, as my guide told me I should, by a magnificent view of Little Haldon, a chain of hills having one central peak higher than the rest, and a valley of green pastureland and cornfields, bearing a marked contrast to the rugged slopes and narrow defiles of the surrounding hills. Several rivulets which water the Luscombe grounds have their source at the base of these hills, and empty themselves into the sea at Dawlish. But I must retrace my steps and notice the "terrace" (I strange

name), which is a lovely grass drive bordered by trees. The trees are principally Larch, and a variety of Pinus mixed, which have an exceedingly good effect. Laurels and other flowering shrubs are dropped in as a kind of groundwork to the higher trees, and pretty and cheerful they look. The trees are now making their young growth of pale yellow or light green, which harmonises or contrasts with the darker coloured foliage. And the drooping Larch, how noble it looks planted alternately with the Pines! From the terrace or drive narrow walks radiate to the right and left, by which the woods may be thoroughly explored, and their beauties fully examined and admired.

A slight *détour* to the right and a junction is effected with the walk, or rather drive, surrounding the pinetum, which is stocked with splendid specimens of the Conifer family, and is several acres in extent. The pinetum overlooks a portion of the park, and in the distance there is a view of Exmouth radiant in the sunlight, for there is not a cloud to be seen upon the azure-blue sky, and a gentle ripple is just noticeable upon the silvery ocean, which lends an additional charm to a matchless landscape. Wild flowers in plenty there are here, call them common who will, but the impression left upon the memory is not soon obliterated. Picture an elegant specimen of *Abies cephalonica* now arrayed in different hues, and literally encircled with a broad band of Blue Bells (wild Hyacinths), and pink *Silene* refreshed with the first dews of evening, and softened with passing shadows and gleams of light intercepted and broken up by specimens of vigorous growth, rare symmetry and beauty. Those *Hyacinths* and *Silenes* have a charming effect by the margins of woodland walks, but it is when they are present in natural looking groups that they become really fascinating.

The most remarkable specimens in the collection are examples of the Douglas Fir, the Hemlock Spruce (*Abies canadensis*), *Abies Morinda* (which droops gracefully), *A. Nordmanniana*, *Pinus insignis*, *Cryptomeria japonica*, *Cedrus atlantica*, &c. From the pinetum I must ask the reader to return with me to the point in the main drive or avenue from Dawlish where I left off to notice the general attractions of the woods and terraces, and other conspicuous and notable features. I had reached a point opposite to the parish church, where the valley breaks into three branches, and at the head of the central one lies Luscombe Castle. One or two rivulets—tributaries of the stream which flows through the centre of Dawlish—take a diagonal cut through the grounds, which are rendered cheerful and lively by their presence. The eye naturally follows the clear running streams, and the trees, too, grow more numerous and interesting. You approach a bridge which spans the parish road, and upon the right of which there is a narrow walk bordered by a charming row of *Picea orientalis*, with the light green tips of its drooping young growths in striking contrast to the dark green of the older foliage. Ascending the bridge, the drive is margined by two fine rows of *Pinus excelsa* and *Abies Morinda*, both of which make excellent and showy specimens for planting by the sides of avenues. Upon the right a pinetum in miniature running out to an acute angle at the junction of another entrance, is a remarkably handsome feature, and the plants, all of the Conifer tribe, have been selected apparently to produce a neutral tone of colour and variety of form. The park is now in view, and without wishing to make invidious comparisons, I may say that it is perhaps unequalled by anything of the same size even in this picturesque county, if in England. The first object that strikes one is a large clump of Beech on the face of a slope, enlivened by the presence of one or more variegated *Sycamores* and flowering Chestnuts; and at some distance off there are two massive rows of Beech running parallel with each other from the base to the summit of the same slope, forming a green drive or avenue, which is lost to view at the top of the hill. Then there is a valley furnished with isolated specimens of Oak and Hawthorns in full blow, which sent the air with their fragrance, and supply that distinct colour which is so delicate to the eye and acceptable in its season. The Oak leaves appear bronzed, the drooping Beech greenish-yellow, and in the distance the irregular margin of Luscombe woods form a deep background of lively green and grey, relieved by the dark leaves of the Copper Beech, sometimes crimson in a flood of sunlight.

But the great feature of the Park is the long sweeping valley, which terminates a short distance beyond

the Castle in a series of ornamental gardens, including a rosery. Close to the drive there is a row of *Pinus insignis*, probably the largest specimens in England; while the steep slopes upon the opposite side are clothed with fine examples of the Douglas Fir, some quaint looking old Mulberry trees, and one or two specimens of the true Service tree. Here again the lovely Hawthorns, white and pink planted in juxtaposition, have a charming effect, and there are also Quinces and other trees and shrubs scarcely less beautiful. The park is now more diversified—it is even romantic. About its centre, a steep declivity separates two large mounds fashioned like a dome, such as Nature makes without rule or pencil. These mounds ascend to a considerable height, and are dotted with Oaks, Cedars, and other trees of an ornamental character. The cricket ground is in the valley beneath, and the ivy-clad walls and towers of the Castle are in full view. The groups of Cedars at the back of the Castle, as represented in the engraving (fig. 116), are upon a steep slope at the entrance to the American garden, which shall be noticed presently. The Castle is exceedingly picturesque in its architectural character, and was built in the early part of this century by Charles Hoare, Esq., on the site of a former mansion—a private chapel and fine conservatory having been added by the late P. Hoare, Esq., the present proprietor's father. A view of this picturesque house is given in Britton's *Beautifuls of England and Wales*. The walls of the Castle upon the chapel side are clothed with *Ampelopsis Veitchii* and *hederacea*, red and white *Camellias*, *Jasmines*, *Magnolia grandiflora*, *Mirtles*, *Banksian* and *Tea Roses*, *Clematis*, and *Wistaria sinensis*. Fancy a view from the library window down the valley described, taking in the grey towers of the parish church, and a peep of the English Channel! And yet, although the Castle appears to lie in a gully, the sill of the library window is level with the sea.

Basket beds are dropped in promiscuously on the gravel between the old conservatory abutting upon the drawing-room, and the new one at the extreme end of the chapel. These beds are arched over with creepers, and their base draped either with *Hedera Roegneriana* or *Pernettyas*, both of which are very suitable for the purpose. The large specimen given in the illustration, is a unique example of *Cupressus Lambertiana* or *macrocarpa*. Beyond the new conservatory the geometrical flower garden and rosery is snugly enclosed between two slopes, covered with evergreen Oaks and other trees, such as are not to be found except where soil and climate are of the most favourable kind. The shrubs here attain unusual proportions, owing to the favoured nature of the situation and the geniality of the climate. They comprise large bushes of *Escallonia macrantha*, *Deutzia crenata* l.-pl., *Berberis Darwinii* and *D. japonica*, *Skimmia obtusa*, *Weigela rosea*, *Garrya elliptica*, which produces its catkins in immense quantities; and hybrid *Rhododendrons*, which make a brilliant show all through the spring months. Of larger specimens there are good examples of *Libocedrus decurrens*, select varieties of *Cupressus Lawsoniana*, and a superb plant of *Araucaria imbricata*, feathered so regularly, and in such rude health, as to entitle it to rank among the finest in the country. It is said to be the finest in England, but it is certainly not the tallest by many feet.

The American garden, as its title would indicate, is devoted exclusively to the cultivation of the choicer kinds of American plants. The natural formation of the ground made it an easy task for the landscape gardener to excel in laying it out. The boundary walks rises and falls and curves so gently, that one can hardly realise the exact shape of the garden. But the shows of *Gent Azaleas* and *Rhododendrons* do not so easily escape notice; nor the fine groves of *Magnolia grandiflora* and *conspicua*; nor the specimens of *Photinia serrulata*; nor the yellow *Berberis*, drooping over the greenward, where you may gather a posy of the wild flowers of Devonshire, and Ferns, too, to go along with them! The kitchen and fruit gardens, about 6 acres in extent, enjoy a southern aspect upon the slope of a hill, about half a mile from the Castle. The entrance to the garden is over a bridge which spans the river already noticed in these remarks. There is a cascade upon the north-west side, where the stream at times dashes over with great force, and the banks are about equally planted with *Tussilago fragrans* and the wild garlic (*Allium*), which, when in flower, is pretty at a distance; but do not come too near to smell it. Both these plants are semi-aquatic,

and planted, as they are here, in combination with banks of hardy Ferns, are very appropriate to the situation.

The garden is said to be very prolific, as may well be expected where soil and climate are of the most favourable character, and the situation all that can be desired. A.

HOME CORRESPONDENCE.

Acer velutinum (?).—In their catalogue for the spring of 1867 Messrs. "Vilmorin, Andreux & Co., of Paris, announced for sale:—"Erable à feuilles velues (Caucase): *Acer velutinum* (Boissier).—Grand arbre à corce plus ou moins lisse, à branches étalées, à feuilles palmati-quinquelobées et velues en dessous, même à la maturité du fruit. Fleurs en grappes corymbiformes, dressées; samares à coque renflée; ailes convergentes; loges très velues, tomentoses intérieurement. Cette belle espèce croit dans les forêts du Mont à l'altitude de 1500 mètres environ."

The plant I sent to Dr. Masters sprang from these seeds. All the hatches was similar, and remarkably glabrous. The late Dr. Karl Koch, when consulted about its identity, supposed it might be a variety of *A. insigne*. I could get no farther, as I never had the luck to flower it in my nursery. It is the hardiest of my eighty species and varieties of Maples, stood perfectly the two disastrous winters of 1879-80 and 1880-81, and being a very late and cautious grower has even never been nipped by the late frosts. [This is not our experience, Ed.] The seeds were collected by Mr. Balansa (I have reasons to believe in Lizaian, about Batoun), at the same time with *Phillyrea decora*, *Acer campestris caucasicum*, *Tilia caucasia*, &c., and *Acer letum*. The seeds of the last did not grow, and I did not regret it much, as Professor Karl Koch told me it was only another name for *Acer ciliatum* (although I only found this last wild except in Lower Daghestan, about Kula and Berberit, in a quite different country). In truth, the seeds looked very similar. Last week I saw in the Botanic Garden of the University of Leyden a Maple labelled *A. letum*, and very distinct from anything I know. Professor Suringar had never paid any particular attention to it, and could not tell me anything about it. As I sent several years ago living plants of my *A. velutinum* (?) to Mr. Lavallee, of Segrez, and Mr. Boissier, of Geneva, they might give their opinion about it by this time. *Jean van Tolson*. [Our specimen seems to be different from M. Boissier's *insigne*. Ed.]

Stephanotis.—Having seen in your last week's issue a notice of a *Stephanotis* characterised by six segments to the corolla, I enclose you one with seven, from a seedling which is flowering for the first time, and very freely. *Wm. Deebman, Titchfield, Hants.*

Stephanotis floribunda.—I noticed in your paper of last week (p. 682) Mr. Sutherland, reporting upon a floriferous example of this truly admirable climber, mentions the fact of a considerable portion of the flowers as having six segments to the corolla. I have to-day examined a very similar plant, growing at Trinity Grove, near Edinburgh (the property of John Milne, Esq.), in a fernery 30 feet long, the whole roof of which is covered with it, and *Passiflora racemosa* intermixed, every axil of the *Stephanotis* showing flowers in various stages of development even on the youngest shoots, each head with seven to eleven pips, the plant a picture of health, and the bloom worth a journey to see; but I failed, in the large number of flowers I carefully examined, to find a single one with more than five sepals, or five lobes to the corolla, the usual number of the *Asclepias* family, to which *Stephanotis* belongs. It would be interesting to know if this sporting is individual or otherwise. The *Passiflora racemosa*, with its long racemes of beautiful bright red flowers, Mr. Maclure, the gardener, assured me had been in flower winter and summer uninterruptedly for several years. *W. E. D.*

Results of the Gale in April.—A wish having been expressed for information as to the results of the great Gale of April, I would point out two shrubs of which the young shoots appear to have been entirely unharmed when exposed to its full force, namely, the Sea Buckthorn (*Hippophae*) and the common Box. The Oaks in West Sussex are still in a deplorable state, any attempt at recovery being checked by myriads of caterpillars, which in many places have descended from the branches, and are devouring the underwood. I am disposed to think that this plague may arise from the destruction of the tics during the late severe winters. *H. K.*

Genista præcox.—At p. 578, when speaking of the above-named beautiful and free-blooming ornament of the hardy shrubbery, you say that one of its synonyms is *odoratus*, which is, I believe, usually understood to mean fragrant or sweet-scented? This, I think,

must be an error on the part of the writer of your paragraph, as the one drawback possessed by this pretty shrub is the disagreeable and pungent odour which it exhales, which altogether prevents its employment for the decoration of vases with other cut flowers, and renders even the nearest approach to the plant, when in bloom, quite unpleasant to anyone with any sense of smell whatever. *H. E. G.* [The word *odoratus* is not confined to sweet-smelling objects—see Latin Dictionary. Ed.]

New Melons.—We have no wish to prolong the discussion on the relative merits or demerits of our Best of All Melon; each variety introduced has its votaries, and we give all credit to Mr. Carmichael and his friends for their opinions. This, however, to our mind, does not prove that Best of All is only of "fair" favour. We may quote the old adage that "What is one man's food is another man's poison," and hence opinions differ, and well it should be so. Put against the judgment of Mr. Carmichael and his friends we can place men of equally high standard of judgment in contradistinction, viz., the late S. Simpson, Esq. (a better judge of the real merits of a Melon never lived), Messrs. B. Findlay, R. S. Yates, J. Hunter, W. Baillie, E. H. Lettis, J. Kilsdale, W. Irvine, R. Gilbert, and dozens more if necessary. Mr. Carmichael finds fault with its not being "certificated," and we have never yet coveted the honour from the Royal Horticultural Society, and have yet to learn that an "uncertificated" fruit or vegetable is debarred from receiving the appreciation of a discriminating public. *Dickson, Brown & Tait, Manchester.*

Viola pedata and V. p. tricolor.—Several plants, obtained under these names from North America last autumn, have proved well worth the price paid for them and for the carriage, though I am told they are not likely to survive for another season. The plants are remarkably fine, being that of a small spheroidal bush, about 6 inches in diameter, covered with blue and yellow flowers, intermediate in size and form between *Violets* and *Fansies*. They were potted in November, and kept in a cold frame till March; then planted out in well-drained soil, and have been in flower all April and May, and are now going off. *C. Wolley Dod, Edge Hall, May 20.*

Wistaria sinensis.—There is a *Wistaria* in these gardens planted at the front of a vineery, which measures at 18 inches from the base 5 feet in circumference; at 10 feet, 3 feet 8 inches, and at 20 feet, 3 feet 7 inches. The plant travels 41 feet before it reaches the top of the back wall of a vineery, then branches two ways with several other branches on the top of the back wall of a Peach-house, 40 feet the other way on the top of the back wall of a vineery. Fifty-six feet from these branches there are thirty-five branches 16 feet long, each branch quite covering the sloped roof of a hot-bed, which is 16 feet from the back wall down to the eaves, and 50 feet long. It had another branch which was blown off four years since, which went 50 feet farther on, on the top of the back wall of a greenhouse. It has its hundreds of branches 2 to 3 feet long branching out of those mentioned above, and is now in full beauty, with thousands of drooping clusters of flowers. *A. George, Bilton Gardens, Devon.*

Drosera peltata.—Amongst many insectivorous plants in the Edinburgh Botanic Garden one of the prettiest is *Drosera peltata*, sent from Adelaide, and grown here last year in the heterophyllous bed. Mr. Lindsay, after a careful comparison of the plant with various Australian species in the herbarium, considers it to be *D. peltata*. The two strongest stems are several inches high (taller than the one stem last year), but they will probably much exceed this length, as the plant grows stronger. Some of the rosette leaves have already fallen off. Low down on the stem are three rather broad petioles, each surrounded by a small undevolved leaf, which with the magnifying-glass is shown to be surrounded with minute glands. Beneath the terminal flower-stem is a whorl of three leaves, and below this whorl are groups of two or three leaves, developed in succession in the same axil as the oldest leaf in each group. The broadly crescent-shaped leaf forms a cup covered on the upper surface with glands, the outer ones reflexed. The back of the leaf is smooth, having two well-marked veins from the stalk in the centre to the two upper corners of the crescent. The plant grows here dies down about August, and becomes a dormant bud. It seems strange that, although Mr. Darwin has shown the extreme interest belonging to the *Drosers*, there are so few exotic kinds, probably not more than six or eight, in cultivation. In Bentham and Hooker's *Genera Plantarum* (vol. i., p. 662) there are said to be a hundred species. *Drosers* are found over the whole world, except in the Pacific Islands. In Bentham's *Flores Australiensis* thirty-nine species are mentioned, as well as two species of

the allied genus *Ilybis*. Another allied genus, from Africa, *Koridula*, of which there are also two species, is described by Sir Joseph Hooker in the *Botanical Magazine* (vol. xxvii., tab. 6533). Both species are shrubs, and one of them is used as a "flycatcher" by the Doers in their rooms. It would not be difficult to send by post freshly gathered seed, or, perhaps better still, plants in their dormant state, wrapped up with damp moss in gutta-percha, if those interested in insectivorous plants would take the trouble to do so. Now that insectivorous plants are so well grown in the Edinburgh Botanic Garden, and in many other public and private collections, they would have every chance of being successfully introduced, and would surely be a most welcome addition to all such collections. *C. M. Owen.*

Seeding of *Primula rosea* and *Arnebia echinoides*.—Some time ago I stated in the *Gardeners' Chronicle* that the seed of *Primula rosea* is not enclosed in a capsule, but borne loose on the receptacle. This statement was rightly said by the Editor to require further explanation, which I am now able to give. I was guilty of careless and casual observation when I last gathered my seed of *P. rosea*.

advantage as I did a short time back in a churchyard, where it was growing close up against the white headstone of a grave, from which it arched out and stood bending over, as if dropping its exquisite pink blooms as love tokens for the departed. Although this *Dicentra* is not quite adapted for growing in open borders, it is of great value for forcing, as it is naturally early, is easily excited, and responds readily to heat, and when in flower it is one of the most telling and handsome things that can be had in a greenhouse, where it stands well and lasts a long time in perfection. To have good plants, with fine developed crowns, for taking up and potting, *Dicentra spectabilis* should be planted out in light rich sandy soil in some sheltered sunny spot, where they can be kept well supplied with water till the foliage shows symptoms of ripening, when a drier condition at the roots will be the most suitable. This planting out will be far better for them than keeping them in pots, as there, however liberally treated, they are too restricted to attain to the size and strength they do in the open. If wanted to force early it is advisable to take them up in the autumn, and alter potting to stand them in cold frames, where they can be drawn from and put into gentle heat, a few at a time, as

positive of his assertion by forwarding a copy of his firm's Potato list in which these Potatos, Adirondack and Queen of the Valley, are offered to customers in 1880-81. As I get no reply to a very courteous communication, I presume rightly that Mr. Kerr has no such proof to furnish, and say so in these columns. Then "An Ayrshire Grower" comes to Mr. Kerr's defence, and declares that he had seed of these two kinds from Kerr & Fotheringham early in 1881. He does not say that he saw them advertised by the firm, or that they offered these Potatos in the ordinary course of trade. His statement is to the effect that seeing these kinds recommended by a well-known Potato grower in the columns of the *Gardeners' Magazine*, early in 1881, he wrote to the firm in question asking if they could supply seed, and some of both sorts was duly sent. This is no proof whatever that the Potatos were offered in commerce. No one puts forth a single atom of proof to show that they were offered the public, although no one doubts but that Messrs. Kerr & Fotheringham had them, and supplied a very few persons with them! What is the fair assumption but this, that the firm had obtained small quantities of these kinds from America for their own planting, and being applied to by the

FIG. 116.—LUSCOMBE CASTLE, NEAR DAWLISH. (SEE P. 743.)

I now find that when the seed is ripe, the capsule splits into five segments, which bend back from the top, and lie upon the five sepals, so that they may easily be mistaken for them. The receptacle is large and prominent, and the seed continues to adhere to it until disturbed by wind and by touch. I enclose a specimen. I am glad to observe that one of my plants of *Arnebia echinoides*, which began to flower before the end of March on an exposed rocky, and which I luckily did not cut down to favour fresh flower-stalks, is producing a good crop of seed. The seeds are already about the size of those of a *Crocus*, and are swelling fast. I am afraid, however, that it will be difficult to collect them, as they are so loosely attached to the very open calyx. *C. Wolley Dod, Edge Hall, Malpas.*

***Dicentra (Dicytra) spectabilis*.**—In open borders this lovely spring-flowering plant generally gets cut and damaged so much either by wind or frost, or both, as to render it quite shabby, but under shelter against a sunny wall it is one of the most beautiful objects that are to be found, as there it escapes injury, and sends up its stems, with their elegantly divided leaves and gracefully drooping racemes of pendulous flowers, in the greatest perfection. Much as I have admired it, I think I never saw it show up to such

required. The way to effect an increase is by division, which should be done in the spring, just as they are starting, as then the eyes or crowns may be seen, and a severance made without injury or loss through decay of the parts. Plants that have been forced ought to be kept under glass in a frame where they can have plenty of air till the leaves harden, when they may be planted out to finish off in the ground, and if left for a year before being taken up again they become very large and flower profusely. *F. Sheppard.*

New Kinds of Potatos.—It will doubtless appear somewhat strange to ordinary readers of this paper that a matter which is simply one of fact, and therefore ought to be as easy of decision as any matter well could be, should yet evoke so much discussion. It will be remembered that I classed Adirondack and Queen of the Valley amongst the new kinds of Potatos put into commerce the first time in the season of 1881-82. Mr. Kerr, of the firm of Kerr & Fotheringham, Dumfries, a well-known Potato exhibitor and trader, takes exception to these two kinds being so placed, and states that his firm had them offered in commerce in the preceding season. He goes further, and invites me to communicate with him direct, and he will give me further information. I did so, asking that he shall furnish me with proof

"Ayrshire Grower," and perhaps some others, let these have small lots, and on the strength of that proceed to declare that this was offering in commerce. In ordinary trade we all understand that such offering means publication in a trade list which is widely circulated or advertised in some widely circulated newspaper. If Mr. Kerr's firm did issue such trade list in which these two Potatos were offered, or if they did advertise them even in the columns of the local Dumfries *Standard*, there ought to be no difficulty in sending either to me or to the Editor such proof, and if it were done there would be an end of the matter. As it is not done I have no other course open but to assume that the assertion that these Potatos were offered to the public prior to the past season is not correct. Instead of replying publicly to my recent strictures in these columns Mr. Kerr has now replied to me, sending what he thinks I must accept as proof conclusive—not the needed trade list, but a printed circular he has compiled showing his success as an exhibitor at various shows, and amongst others that at the Crystal Palace last autumn. Herein he states that he took the second prize in the class for three new varieties in commerce not offered before season 1880, with a collection which included Adirondack and Queen of the Valley; but as he has failed to show that these kinds at the time they were shown or in the

proper season had been offered to the public in this country, he does not prove that he took the prize with sorts that were not eligible to compete. In spite of the protest which indignantly enough comes alike from Mr. Kerr and the "Ayrshire Grower" against my suggestion as to what shall be held to be publication of offer in commerce, I feel now more than ever the need of adhering to it. *A. D.* [We have a letter from Mr. Kerr, dated May 30, in which he re-affirms his former statements, but does not give proof of the same by showing publication, in the usual trade channels, of his ability to have supplied tubs of either of the varieties in question, but only says that he has put them on a few pounds can hardly be called putting them into commerce. We can, however, see no good in continuing the discussion further. Ed.]

Lychnis vespertina flore-pleno.—Can any correspondent tell us how to make cuttings of this fine plant root? Cuttings taken in early spring remain green for several months; but I have never yet persuaded them to root, and am told the secret has not yet reached England, and that the plants are all imported. *C. Wolley Dod, Edge Hall.*

Reports of Societies.

Manchester Royal Botanical and Horticultural: May 26—June 2.—The grand national horticultural exhibition of this Society, which now in its full title embraces the northern counties, and which concluded yesterday, was one of the finest we have witnessed, even on the classic ground of increasing flower-shows, and which have now gone on successful and improving for sixteen consecutive years. The Manchester show is always rich in Orchids, and this year it may be called superlatively rich, notwithstanding that some well-known and prominent trade collections are absent. Stove and greenhouse plants, foliage plants, Palms, are all good—some of the Ferns, especially the 1st prize group of tender kinds, and consisting chiefly of *Gleichenia* and *Davallia*, are highly remarkable for their handsome growth and extraordinary freshness. The Clematis from Messrs. G. Jackman & Son of Woking, were, in our view, the most remarkable feature, the specimens being even better than those exhibited last week in the South. Groups arranged for effect were also an important feature, and occupied a considerable portion of the great annex tent. They were generally very well set up, the exhibitors being most of them awakening to the fact that "effect" is not to be obtained, even by the choicest plants, if they are crammed together in dense formal solid banks, and not broken up on the surface by graceful or attractive specimens. The alpine and herbaceous plants, always a feature here, deserve a word of commendation, since they contained many choice species and many well-grown specimens.

ORCHIDS.—In the leading class for fifteen plants, G. W. Hardy, Esq., Timperley (Mr. Hill, gr.), was very properly placed 1st. The collection was remarkably fine, and one of the best fifteen ever staged. There was a splendid mass of *Dendrobium Vardianum*, with about thirty well developed stems, each being covered with finely-coloured blossoms; near it stood *Odontoglossum vexillarium*, 4 feet across, the surface being literally all flower. The Dalkheite variety of *Vanda tricolor* bore two handsome spikes; then came *Masdevalla Mendelii*, 3 feet across, and *Masdevalla Harryana*, 2½ feet, both well-bloomed; of *Odontoglossum crispum* (Alexander) there was a remarkably fine variety, with flowers measuring 4 inches across, the sepals and petals flushed with rose and the lip spotted; *Dendrobium clavatum*, with rich yellow of soft coloured flowers, was magnificent; *Odontoglossum cicutum* near it was 3 feet across and bore about thirty panicles of its singular and handsome blossoms; *Anguloa Clowesii* bore about a score of its bright yellow cradle-shaped flowers; the rich-lipped *Cattleya Warreni* was there with eight of its handsome rose-tinted flowers; *Cypripedium niveum*, with thirty-six flowers; *Dendrobium densiflorum*, with over two dozen spikes; *Cattleya Mossie*, fully 3 feet across; and good examples of *Cypripedium Lawrenceanum* and of *Dendrobium Jamesianum*. R. B. Dodgson, Blackburn, who was 2d, arranged another wonderfully fine lot of plants, including *Masdevalla Veitchiana*, 3 feet through, on which we counted over eighty flowers; a grand *Cypripedium villosum*, 3½ feet across; *Calanthe veitchiana*, *Acridis crispum*, with three good flower-spikes; *Epidendrum venustum*, nearly 2 feet tall; plants, including *Masdevalla Harryana*, *Dendrobium densiflorum*, *Cattleya Mossie*, *Cypripedium barbatum superbum*, *Cattleya Warner*, *Vanda suavis*, with three spikes; *Lelia purpurata*, with twenty-one flowers, several of the spikes being four-flowered; *Dendrobium Australiense*, *Cypripedium javanicum biflorum*, and *Odontoglossum vexillarium*, 3 feet over. J. Broome, Esq., Didsbury (Mr. Weddell, gr.), was 3d, with

a very neat lot of smaller but well-bloomed plants, having *Vanda suavis* as a back centre supported by *Dendrobium Devonianum* and *Lelia purpurata*, *Dendrobium luniflorum*, *Aerides Fieldingii*, *Cattleya Mendelii*, *Lelia majalis*, and others.

In the class for nine plants Mr. Hardy was again 1st, with an exceedingly fine group containing as centre a 4 feet spike of *Odontoglossum vexillarium*, of high colour, backed by a fresh plant of *Anguloa Clowesii* with eighteen open flowers, and supported by a *Cattleya Mossie* 3 feet across, and C. Mendelii superba, nearly as large, with *Dendrobium Jamesianum* and *Tenisonia*, *Odontoglossum crispum*, and the rich orange colour *Ada aurantiaca*, the 2d prize fell to O. Schneider, Esq., Fallowfield (Mr. Holmes, gr.), who had a large *Oncidium*, 5 feet high, with seven panicles of flower; *Epidendrum vitellinum*, with twenty-four spikes of bloom; *Aerides Fieldingii*, with three spikes, small but good; and a pretty lasket plant of *Dendrobium Falconeri*. R. B. Dodgson, Esq., who was placed 3d, had a nice plant of *Oncidium Marshallianum*. The 1st prize for a group of six Orchids went to R. P. Percival, Esq., Southport (Mr. G. Beddoes, gr.); the group consisted of *Oncidium Clowesii*, with about twenty very finely bloomed; *Odontoglossum vexillarium*, equally large and fine; *Cypripedium Lawrenceanum*, with about twenty flowers, a charming plant, set off by its finely mottled leaves; a good *Cattleya Mendelii*, *Dendrobium thysitiforme*, and *Anguloa Clowesii*, with about twenty attractive flowers. The 2d prize fell to Morton Sparkes, Esq., Hurston (Mr. Sherwin, gr.), who showed *Cattleya Mossie* magnificent, with about thirty flowers; *Cypripedium caudatum roseum*, with ten finely developed blossoms; *Oncotoglossum Hallii*, with five panicles of bloom; *Dendrobium nobile*, *Odontoglossum vexillarium*, 3 feet across; and *Masdevalla Harryana*. The 3d prize group came from C. Walker, Esq., Milnthorpe (Mr. McGregor, gr.), who had good examples of *Masdevalla Harryana* and *Lindeni*; and a fine piece of a large-flowered variety of *Oncidium*, of unusually high colour. The 4th prize was provided for six *Cattleyas*, in which the 1st prize went to Mr. Hardy for moderate specimens of C. Mendelii (2), Warneri, Warneri superba, very fine; Mossie, and Mossie marmorata.

In reference to the nurserymen's classes, the absence of Mr. Williams' usual exhibition may be noted. The 1st prize in this class was awarded to Mr. James Norwood, for a fairly good collection containing *Oncidium Marshallianum*, macranthum, ampliatum, and concolor; a good pan of *Cypripedium concolor*, *Masdevalla Harryana*, with *Cattleyas*, *Lewalis*, *Odontoglossos*, &c. Mr. Cypher was 2d, and had a fine group of *Dendrobium phalaenopsis*, *Oncotoglossum*, &c. The prizes in the class for ten went to the same growers in the same order, Mr. James showing a pot of *Oncidium tolosa* with sixteen spikes of flower, and Mr. Cypher neat plants of *Cypripedium Hookeri* and concolor, and a *Cattleya citrina* with half a dozen good flowers.

NEW PLANTS.—For twelve new and rare plants Mr. B. S. Williams, Holloway, won the 1st place. His group consisted of *Draecena Lindenii*, a very fine thing, with narrow recurved leaves; *Leontodon*, a very fine plant; broad bands of yellow-green on each side the dark green centre; *Alocasia Cheloni*, *Kentia costata*, *Adiantum Williamsii*, 3 feet over, a very striking plant; the bold *Aralia spectabilis*, with long glossy pinnate-pinnatifid leaves; the dense-growing *Aralia Cheloni*, which will bear a very good deal of frost; *Croton Warrenii*, one of the best of the ringleted *Crotons*; *Alocasia Cheloni*, with bold dark green leaves and ivory veins; *Asplonia Rebecca*, *Anthurium Veitchii*, figured in our volume vi., 1876; and *Cycas undulata*. Messrs. Kerr and Liverpool were 2d, with *Ficus elastica variegata*, a very promising plant, with irregular marginal variegation of yellow-green; *Delabachea rupestris*, *Draecena Lindenii*, very finely coloured, and very handsome; *Croton Warrenii*, *Juncus zebrinus*, 4 feet high; *Adiantum Lathoni*, *Asplonia Rebecca*, *Lomaria obtusata*, a very pretty small-growing Fern; *Heliconia aureo-striata*, *Dicentra Beccari*, and *Anthurium undatum*. Equal 3d prizes were awarded to Mr. Cypher, Cheltenham, for a group containing the bold *Croton Kingianum*, with dark green and gold variegated leaves as large as the recurved leaves of *Draecena Lindenii*; these three fine varieties of *Anthurium Scherzerianum*, named Wardii, Hendersoni, and Cypheri; and to Messrs. W. & J. Birkenhead for a collection composed wholly of Ferns, and including the pretty glaucous-leaved, bipinnate, *Asplonia Rebecca*, and *Ficus elastica variegata*, with *Delabachea rupestris*, *Asplenium splendens* and *Asplenium*, *Yugonogramma hispida*, and the pretty *Polystichum acrostichoides grandiceps*, described at p. 492.

The only amateur's group of six came from R. B. Dodgson, Esq., and consisted of *Asparagus plumosus nanus*, *Cypripedium Lawrenceanum*, *Croton Warrenii*, *Aralia spectabilis*, *Delabachea rupestris*, and *Cycas undulata*.

First-class Certificates under this head were awarded to Mr. Williams, of Holloway, for *Adiantum Lathoni*, *Phalangium gentianissimum*, *Doodia aspera multifida*, *Asparagus plumosus nanus*, and the *Elvaston variety* of *Stephanotis floribunda*; to Messrs. Kerr, of Liverpool, for the *Ficus elastica variegata* already mentioned, *Adiantum Victoriae*, and *Leeca analabalis*; and to Messrs. G. Jackman & Son, Woking, for *Clematis alba magna*, which was shown with its broad sepalled flower fully 10 inches in diameter; and Mrs. Hope and Princess of Wales, two of the mauve-coloured series, also remarkable for their breadth of sepal, which fills up the outline of the flower to the very centre.

STOVE AND GREENHOUSE PLANTS IN FLOWER.—These are always a conspicuous feature at Manchester,

and with the Orchids made up bright and attractive patches of colour in the large conservatory. S. Schloss, Esq., Bowden (Mr. C. Paul, gr.), was a remarkably good 1st, with a very fine example of *Stephanotis floribunda*, *Anthurium Scherzerianum*, *Clerodendron Balfourianum*, *Erica Cavendishii*, *Erica Cavendishii*, and two fine *Azaleas*; 2d, John Rylands, Esq., Streteford (Mr. George Smith, gr.), who had good examples of *Bougainvillea glabra*, *Azalea Roi Leopoldi*, *Anthurium Scherzerianum*, *Alphelia macrantha purpurea*, &c. In the nurserymen's class for ten, and Roi des Doubles. In the amateurs' class smaller and less noticeable plants were shown, and the 1st prize was withheld.

AZALEAS.—These were in nothing like the form in which they have been wont to be shown in Manchester, the best group of eight plants coming from Messrs. E. Cole & Sons, whose leading plants were Stanley and Criterion, Marie and Roi d'Hollande. Mr. Cypher was 2d, having Jacksoni, a good crimson-flowered variety of *Erica Cavendishii*, and Roi des Doubles. In the amateurs' class smaller and less noticeable plants were shown, and the 1st prize was withheld.

ERICAS.—In the amateurs' class for six Mr. Smith was 1st, but the collection contained nothing worthy of special mention. In the nurserymen's class for the same number Mr. Cypher had good examples of *E. ventricosa magnifica*, *grandiflora*, and *coccinea minor*, *E. deplanata*, *E. Cavendishii*, and *E. affinis*; 2d, Messrs. W. G. Caldwell, Knutsford.

ROSES IN POTS.—The large plants from Slough and Chesham not being forthcoming on this occasion, the show of these was only of a moderate character. There was not a single entry in the nurseryman's class for twenty plants, and in that for amateurs Mr. John Heywood, The Grange, Streteford, and Mr. W. Brockham, The Nursery, were 1st and 2d. In the class for thirty Roses in pots the 1st prize was properly withheld, and a 2d prize awarded to Mr. John Hooley, Stockport. A special prize was awarded to Mr. John Heywood for a group of twenty-five plants.

CLEMATIS.—These were unquestionably the feature of the show. The plant-loving public of Manchester are accustomed to see grandly flowered and huge specimens of Orchids, but such a sight in the way of species of Clematis has never before been seen here or elsewhere. Messrs. G. Jackman & Son, of Woking, won renown by bringing all the way from Surrey and staging in such superb condition so grand a lot of plants, sheathed in luxuriant foliage, and covered with clusters of splendid proportions and fine tints of colour. All the prizes were of the languinous type, with the exception of the double white *Duchess of Edinburgh*, which belongs to the Florida section. The deepest coloured varieties were *Mauve Gem*, *William Kennet*, *Robert Hanbury*, *Blue Gem*, &c. Mrs. Hope was 1st, with *Princess of Wales* (very fine), and *Duchess of Norfolk*. The palest flowers were Mr. Moore, *Alba Magna* (very fine), and *languinous candida*. Messrs. R. Smith & Co., nurserymen, Worcester, were 2d, with a collection of the above in the amateurs' class. Mrs. Hope has taken the 1st prize, but they were so far behind them in point of development. The best varieties were *Sensation*, *Marie Lebevre*, *Lawsoniana*, *William Kennet*, *Lord Nevill*, *Otto Frobels* (fine form, and very good), *Madame Grange*, &c. In the amateurs' class for six Mr. J. Hooley, Woking, was the only exhibitor, and took 1st prize with some moderate plants.

PELAGONIUMS.—The best eight varieties of show Pelargoniums in the nurserymen's class came from Mr. C. Kynlance, Ormskirk, and very good they were, nice, well grown and flowered specimens, the varieties *Brigitine*, *Duchess of Edinburgh*, Mrs. Bradshaw, *Triomphe de St. Maude*, *Patroness*, *Prince Leopold*, and *Venus*; 2d, Messrs. T. Lazenby & Sons, York. In the amateur class for six varieties of Pelargoniums Mrs. Hope was 1st; and Mr. P. Gill, Wood Hayes Hall, 2d. Mr. Kynlance was the only exhibitor of eight Fancy Pelargoniums in the nurserymen's class, staging good sized well flowered examples, and taking the 1st prize. There was no entry in the amateurs' class for six plants. Zonal Pelargoniums were a bright and effective feature, the plants well grown and bloomed. Messrs. Rynlance and Lazenby & Sons were severally 1st and 2d with eight plants; and Messrs. Summer and Silkenstat with six plants. The varieties were generally well known sorts. The six varieties of Pelargoniums shown by Mr. Summer, were remarkably good, large, well grown and coloured, and were decidedly in advance of the nurserymen's plants. Mr. J. Kershaw, Cheltenham Hill, was a good 2d to Mr. Summer. Mr. Kynlance was again 1st in the nurserymen's class, and the York firm 2d.

PANSIES AND VIOLAS IN POTS.—These were largely shown, and made a very pretty and attractive display. They were made in plants in cups, but capital heads of bloom were furnished. In the amateurs' class Mr. Sargent had the best six show Pansies, Mr. G. Whitefield, Bowden, being 2d. Mr. Joseph Broome was 1st with six fancy Pansies, and Mr. Whitefield 2d. Mr. D. McCure, Heston, Mersey, had the best six Violas, Mr. J. Broome being 1st. Amongst the Pansies in the flower blue blotched with white on the margins, like Maggie, was very good. In the nurserymen's class for twenty show Pansies in 8-inch pots Mr. Henry Hooper was 2d, the 1st prize being withheld. With twenty fancy

Fansies Mr. Thomas Walkden, Sale, was a good rust, and Mr. Hooper, 2d, had the best twenty pots of *Violas*, Mr. John Hayward being 2d.

MISCELLANEOUS FLOWERING PLANTS.—These included Anaryllids, of which six being staged by Mr. George Hardy, of Timperley, who was the only exhibitor, a good twelve being staged by Mr. B. S. Williams, who was placed 1st, and was the only exhibitor. *Calceolarias* were prettily well represented, but with the exception of the 1st prize lot of ten plants from Mrs. Eastwood, Rhododendrons were not represented in the amateur class, but in the nurserymen's division Messrs. Fisher, Son & Sibray, of Sheffield, staged a very fine group of nearly seventy plants, which are referred to elsewhere. They were most deservedly awarded the 1st prize, and were one of the features of the show. Their were much better grown than we generally see then.

FINE-FOLIAGED PLANTS.—The groups of these were a leading feature, and being ranged in great part round the back stages in the conservatory, the flowering plants being in front. Mr. Geo. Smith staged a fine group of ten on behalf of Mr. John Rylands, having noble examples of *Friedlandia pacifica*, *Croton discolor*, *Alcascia Lovii*, *Variegata*, fine; *Arcyria*, *Calceolaria*, *Croton Weismanni*, &c. 2d, T. H. Birley, Esq., Manchester (Mr. E. Elkin, group), who had, as the most conspicuous object in the group, *Cibotium regale*, *C. Schiedeii*, *Latania borbonica*, *Cocos Weddelliana*, and *Phormium tenax* variegated. The nurserymen's class for eight plants Mr. Cypher was adjudged 1st, having well developed examples of *Latania borbonica*, *Thrinax elegantissima*, *Cycas revoluta*, *Cordylina indica*, *Kentia Fosteriana*, *Croton majesticus*, *C. discolor*, and *Dasylicapillum acrostichoides*, 2d, Messrs. E. Cole & Sons, who had *Kentia Fosteriana*, *Thrinax parvifolia*, *Thrinax elegans*, *Gleichenia Mendelii*, *Cycas revoluta*, &c. The best four Palms came from the Earl of Wilton, Heaton Park, and consisted of *Cocos Weddelliana*, *C. nucifera*, *Latania borbonica*, and *Kentia Fosteriana*. 2d, Mr. Geo. Hardy, who had good specimens of *Geonoma elegans*, *Thrinax majestica*, and *Cocos Weddelliana*. In the nurserymen's class for a pair of Palms, Messrs. E. Cole & Sons were the only exhibitors.

FERNS.—In the amateurs' class for eight stove or greenhouse varieties a truly splendid group came from Mr. S. Schloss, which did Mr. Paul, the gardener, very great credit. The group consisted of *Gleichenia rupestris*, *G. fabelata*, all in rare form, *Davallia tenuifolia*, *D. Mooreana*, and *Gonophlebium subarticulatum*. 2d, Mr. A. Birley. Pairs of *Ferns* were a useful feature, as they were made use of for dotting about the annex to impart effect to the groups. In the class for twelve hardy ferns, a very fine lot was staged by Mr. G. Henderson, Worsley, who had remarkable specimens of *Athyrium*, *L. f. plumosum*, *Osmunda regalis* var. *purpurascens*, *Lastrea f. m. grandiceps*, *O. regalis cristata*, &c. 2d, Mr. W. Brockbank, with a very good lot. In the class for six Filmy Ferns, Mr. Lettice Grove Hall, was 1st with *Todea pelucida*, *T. superba*, *T. radicans*, *Cheilanthes*, *Hymenophyllum densissimum* and *H. crispatum*. 2d, Mr. John Rylands, with a good 2d prize lot.

CROTONS.—In the nurserymen's division the groups of ten distinct forms were a leading feature. Messrs. R. P. Ker & Son, nurserymen, Liverpool, staged a grand lot, all with superbly coloured foliage, consisting of *Weismanni*, *Bergmanni*, *Warreni*, *interpunctus aureus*, *Variegata*, *Elkingtoni*, *Worsleyi*, *Worsleyi*, *Worsleyi*, *Worsleyi*, *Worsleyi*, *Worsleyi*, *Worsleyi*, and *D'Israeli*. 2d, Mr. J. Cypher, who had smaller but very nice plants of much the same sorts. In the amateurs' class for six Mr. Schloss was 1st, with fine examples of *angustifolius*, *D'Israeli*, *picatus*, *Queen Victoria*, *Weismanni*, and *majesticus*; 2d, Mr. R. B. Dodgson, with large but not well coloured plants.

DRACENAS.—The best group of twelve was staged by Messrs. R. P. Ker & Son, a very good lot indeed, the variety in the sort in *Dracaena* leaves being *Dracaena* were *Baptisia*, *picata*, *recurva*, *Gladstonei*, *anabilis*, *Lancei*, *alba marginata*, and *Regina*; 2d, Mr. Henry James, nurseryman, Nortonwood, with smaller and less finely marked plants. In the amateurs' class for six plants, Mr. B. Dodgson, Esq., staged some fine specimens of *Mooreana*, *Excelentia*, *Berkleyi*, *Baptisia*, *anabilis*; 2d, Mr. Joseph Broome, with smaller but nicely grown plants.

FITCHER PLANTS.—The best ten in the amateurs class was staged by Mr. Joseph Broome, some of them remarkably good specimens. The leading types were *Nepenthes Raflesiiana grandis*, *robusta*, and *Sarracenia flava*, *various*, *flava picta*, *Drummondii*, and *purpurea*. 2d, Mr. Joseph Hides, Chelmsford. The only exhibitors in the nurserymen's class for the same number was Mr. B. S. Williams, who had good examples of *Nepenthes intermedia*, *paradisii*, *Hookeriana*, *Dominiana*, *Courti*, *Sedeni*, and *rubra*.

GROUPS OF PLANTS FOR EFFECT.—These were a very fine feature in the annex, and were so grouped by Mr. Findlay that the effect as a part of the vista opened up from either end was most interesting. The best group of 30 feet by 15 feet came from Messrs. R. P. Ker & Son, a remarkably good lot of stuff arranged with much artistic taste. Messrs. E. Cole & Sons were 2d. In the amateurs' class the dimensions of the group were 25 by 12 feet, and here Mr. J. Rylands was 1st,

Mr. Thomas Agnew 2d, and Mr. S. Schloss 3d. A good deal of artistic skill was shown in the arrangement of all. Mr. Schloss's group contained a number of most prize-worthy plants.

ALPINE AND HERACACEOUS PLANTS.—These are always good at Manchester, in the amateurs' class for thirty plants, J. Broome, Esq., Didsbury (Mr. T. Entwistle, gr.), was 1st with a very good lot, including *Orchis maculata* seedling *Verbascum*, in very pleasing variety; *Lychnis Haageana*, *Cypripedium parviflorum*, *Onosma laurica*, *Fuchsia*, *Adiantum*, &c. 2d, Mr. W. Brockbank, with a good lot also, among which were some striking novelties, such as *Verbascum Malcolmei*, *Ranuncula pyrenica*, *Litosperrum prostratum*, *Campanula thyrsoidea*, *Orchis foliosa*, *Saviraga MacNabiana*, the *Edelweiss*, *Aconitum Napellus*, *Iberis gibraltra superba*, &c. In the nurserymen's class for groups of eight plants, Mr. W. Brownhill, Sale, was 1st with a fine lot, and Messrs. James Dickson and Sons, Chester, 2d. All these groups were of a very interesting and instructive character.

TABLE DECORATION.—Several tables, arranged for twelve persons, competed in this class. The best was set out by Mr. James Cypher, in his usual elegant style. Messrs. J. Williams, Holloway, 2d; and Messrs. Jones & Sons, Shrewsbury, 3d. All looked very fresh and nice, and they were a conspicuous feature of the show. The best three hand bouquets in the nurserymen's class came from Mr. James Mason, Manchester; Mr. J. Curtis, Birmingham; and Murray, being 2d. In the amateurs' class for two bouquets, Miss Johnson, Ascot, was 1st, and W. R. P. Gill, 2d.

MISCELLANEOUS GROUPS OF PLANTS, &c.—These comprised a collection of new and rare plants from Mr. B. S. Williams, Holloway, and the Liverpool Horticultural Company; hardy Rhododendrons from Mr. John Hayward; a group of Japanese Acers from Messrs. Standish & Co., Ascot; Rhododendrons from Messrs. J. W. G. and British Ferns from Messrs. T. W. G. & H. Stanfield, Sale. To all these was extra praise awarded. The Medal of the Society was awarded to Mr. S. Johnson, Ascot, for his ornamental flower vases.

FRUIT.—This was naturally enough somewhat restricted in quantity. The best eight dishes came from Mr. G. T. Miles, Wycombe Abbey, and consisted of Black Hamburg and Early Summer Frontignan Grapes, Lord Napier's Peaches, Grosse Mignonne Peaches, Melons, Figs, Strawberries, and Glass Cucumbers, 1st, Mr. J. H. Hutten Hall, Guisborough, with a very good lot; 2d, Lord Hill, Hawkstone. The best two bunches of black Grapes were splendid Hamburgs, from Mr. James Loudon, The Quinta Gardens, Chirk; Mr. Ackers, of Colington, being 2d in the same variety of bunch; 3d, Lord Hill, Hawkstone. The best white bunches of black Grapes were splendid Hamburgs, from Mr. James Loudon, The Quinta Gardens, Chirk; Mr. Ackers, of Colington, being 2d in the same variety of bunch; 3d, Mr. F. Leyland coming next with Foster's Seedling. The best two Pines came from Mr. T. R. Summer; the best single Pine from Mr. C. Bailey, Abergeynny; Mr. Summer being 2d. Of Strawberries in pots there were a great lot; Mr. Summer, and the best twelve, and Mr. J. Brown, Kenilworth, came 2d. Some good Mushrooms were shown by Mr. John T. Barber. A few Melons were staged, and to one of them a scarlet-fleshed variety, named Shelton Abbey Scarlet-flesh, sent by Mr. E. H. Ford, of the Shelton Abbey Estate, Ireland—a First-class Certificate of Merit was awarded.

TULIP SHOW.—On Saturday, the 27th ult., the annual exhibition of the Old National Tulip Society was held at the Botanical Gardens, Old Trafford, in connection with the great show. We were glad to notice a much neater arrangement of the flowers generally, and the use of bottles of almost every description, shape, and form, and the use of the dark glass, with a broad bottom and a thin neck, which, at the suggestion of Mr. Samuel Barlow, the President of the Society, have been obtained for the permanent use of exhibitors. The show lasts but one day, but it seems to have awakened a great amount of public interest. It was not nearly so large as usual, owing to excesses which have been mentioned by us; still there was a good representation of flowers on the whole, and some new exhibitors joined in the competition. The quality was fairly good, but the blooms had been subjected to a great change of temperature, the weather being so cold, and the plants got wet and the plants got wet to work, and when they began to throw up their flower-stalks it became very cold, which operated against a fine development of bloom. It has been a bad season for feathered flowers, as the petals were blighted, and the blightishes on these spoil the flowers more for exhibition purposes than in the case of the feathered blooms.

In the cup class for twelve blooms, Mr. Samuel Barlow, Stakehill House, was placed 1st, with a stand containing a few flowers of excellent quality, such as Heroine, feathered rose; Adonis, flamed byblumen; Sir Joseph Paxton, flamed bizarre; David Jackson, flamed byblumen; Dr. Hardy, flamed bizarre; Annie McGregor, flamed rose; and Talsiman, flamed byblumen—a good bloom in some respects, but too densely colored. 2d, Mr. D. Woolley, Stockport, with Madame St. Arnaud, feathered rose, very fine; Mabel, ditto; Sir J. Paxton, feathered bizarre; Sovereign, ditto; and Dr. Hardy, flamed bizarre. The other blooms were too small generally. Mr. H. Travis, Royton, and Mr. W. Sharpley, Wakefield, were 3d and 4th. In the class for six flowers, in which one feathered and one flamed flower of each division has to be shown, Mr. John Parry, Wakefield, was 1st, with Sir J. Paxton, feathered bizarre, very fine; Charles, feathered rose, flamed bizarre; and Dr. Hardy, flamed byblumen, as his best flowers. 2d, Mr. Samuel Barlow, with a magnificent Talsiman, flamed byblumen; Storer's No 4,

feathered bizarre; Mrs. Jackson, feathered byblumen, with a very rich black feathering on a pure white ground, &c.; 3d, Mrs. Masterpiece, feathered bizarre; Mabel, flamed rose, being good. In the class for four blooms Mr. H. Housley, Stockport, who was in good form, was 1st, with Royal Sovereign, feathered bizarre; Madame St. Arnaud, flamed rose; Heroine, feathered rose; Sir J. Paxton, flamed bizarre; Duchess of Sutherland, flamed bizarre; and Violet Admirable, feathered byblumen. 2d, Mr. E. H. Schofield, who staged a very fine Masterpiece, feathered bizarre. Mr. H. Housley had the best three feathered Tulips, staging Royal Sovereign, bizarre; Madame St. Arnaud, flamed rose; and Heroine, feathered rose. Thomas Parkinson coming next with Adonis, byblumen; Heroine, rose; and Royal Sovereign, bizarre. The best three flamed flowers were Trionphe Royale, rose; Sir J. Paxton, bizarre; and Princess Royal, byblumen. Mr. J. Thornton came 2d, with a very fine Sir J. Paxton; bizarre; Lady Constance, Gordon, rose; and Duchess of Sutherland, byblumen. 3d, Mr. H. Housley.

Passing over the classes for pairs, and also for single flowers, for which there were several classes, we come to the breeders, which are always most attractive because of the rich self-colours. The best six came from Mr. Barlow, breeders being always a strong point with this well-known grower. They were excellent flowers of Excelador and Sir J. Paxton, bizarre; Martin's 117 and seedling, byblumen; Lucretia and Lady Grosvenor, rose; Mrs. J. H. Housley, feathered rose; Sir J. Paxton, bizarre; Industry and Mabel, rose; Alice Gray and Surpass le Grand, byblumen. 3d, Mr. B. Simonite with five good seedlings, and Mr. Barlow, rose. Mr. B. Simonite had the best three, staging seedlings of good promise; Mr. Housley being 2d, and Mr. S. Barlow 3d.

In the three classes for single flowers, and also for a great many flowers were staged, and then it fell to the lot of the judges to select the premier breeder, that being Sir J. Paxton, shown by Mr. John Wood, a variety that almost invariably attains this position. The premier breeder of the feathered flower was awarded to Mr. Parkinson in his stand in the class for two Tulips, one feathered and one flamed; and the premier feathered flower, Royal Sovereign, shown by Mr. H. Housley in his stand of six blooms: a fine feathered bizarre named Earl Lilford, shown by Mr. B. Sharpley, ran Royal Sovereign very hard for this position.

Bath and West of England Society's Show at Cardiff.—The show of the Bath and West of England Agricultural Society was opened in Cardiff on Monday, the 26th inst., under the most favourable auspices. Cuthbert Parker, Esq., M.P., presided, by the permission of the Marquis of Bute, is one of the finest in the kingdom for the purpose, being close to the main thoroughfares of the town, and having other advantages not always available. The weather was all that could be desired, and the show was successful in many particulars. Horticultural buildings were sent by various firms. Mr. J. Crispin exhibited Hunt's patent automatic ventilation, and various forms of houses and frames were shown by Mr. W. Farham, Bath and London; Messrs. Light and Lacey, Birmingham; and Messrs. W. Richardson & Co., Darlington, and Wheeler, Nottingham. An attractive stand of garden pottery was exhibited by Mr. J. Matthews, Weston-super-Mare; and from Mr. C. D. Phillips, Newport. The mouthpiece, carried highly ornamental cast metal vases, painted a neat imitation of the original, and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork.

The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J. Proctor, Bristol; the Avon Manure Company, also from Bristol; Adams' Chemical Manure Company; and Messrs. W. & H. M. Goulding, Dublin and Cork. The large and lofty erection, with canvas roof and wooden ends, contained the display of horticulture in large and filled with plants. A local firm, Messrs. Cross Brothers, Cardiff, had rustic work in cork for summer-houses and *jardinieres*. A display of various mowing machines was also by this firm, and also Mr. W. G. Gardner, M.P. Mowers and reapers, Head & Jefferys, John Williams & Sons, Cardiff; Messrs. J. Crowley & Co., Sheffield. Extensive displays of seeds and roots were made by Messrs. Sutton, Reading; Webb & Sons, Stourbridge; and J. C. Wheeler & Sons, Gloucester; while the patronage of the public was solicited for bone and other manures by Mr. H. J.

cut blooms of Tea Roses, Pansies, Pyrethrums, Carnations, tuberos Begonias, and Clematis; also nice batches of Gloxinias, tuberos Begonias, &c., in pots.

Exhibits contributing to the display in the horticultural part were sent in by Messrs. R. Smith & Co., Worcester, who had the rockwork; Messrs. W. & A. Wood had plants and cut blooms of Clematis; by Messrs. Kellway & Son, Langport, who showed attractive stands of Pyrethrums, Tuberos Begonias were exhibited by Messrs. J. Laing & Co., Forest Hill; by Messrs. H. Hooper, & Sons; Pelargoniums by Mr. W. Treseder, Cardiff, who also supplied the bedding plants used in the tent. Extensive exhibits were also sent in by many of the local nobility and gentry, amongst which may be mentioned a general collection of plants from Cardiff Castle (gr. by Mr. Pettigrew), W. C. Laird, Esq. (gr. by Mr. Woodward), had varied exhibits, very prominent being two immense plants of Adiantum farleyense, Palms and lofty Tree Ferns, were exhibited from Singleton, Swansea (gr. by Mr. Harris); Pelargoniums and pot Roses came from C. Stallybrass, Esq. (gr. by Mr. J. Parker). Large specimen stove plants from J. Howell, Esq. (gr. by Mr. J. Hennings), greatly assisted the effect of the arrangement; a grand plant of Anthurium Scherzerianum giganteum was finely bloomed, the individual spathe being grand in colour and size. A very good Enecephalartos was exhibited, but with a name appended, indeed, at noon on the 2nd, the very few cuttings were not up owing to some mistake about sending them on. Other exhibitors, as far as we could make out, were J. Fisher, Esq. (gr. by Mr. W. May), Colonel Tuberville (gr. by Mr. J. Hawkins), Colonel Page (gr. by Mr. T. Armitage), Lord Teignmouth (gr. by Mr. W. Treseder, Cardiff), R. Crosskill, C. Thomson, Esq. (gr. by Mr. Ryder), E. Fowler, Esq. (gr. by Mr. C. Parker).

Reading Horticultural, May 18.—This was one of the most successful exhibitions the Society has ever held, as the show tent was filled to overflowing, and the fruit and vegetables had to be staged in an annex; the quality generally was good, the weather fine in the extreme, and the attendance large.

As is usual at the spring show, stove and greenhouse plants were the chief feature. Mr. E. Tudgy, gr. to J. H. G. Williams, Esq., Henwick Grange, was 1st, with an excellent collection of twelve plants. Mr. W. Lees, gr. to Mrs. Marsland, The Wilderness, the champion among the leaf growers, had to take 2d place, with several very good plants. Mr. E. M. 2d, gr. to H. J. Simonds, Esq., Crossingham, being 3d. In the class for six varieties Mr. J. F. Mould, nurseryman, Pursey, was 1st; and Mr. Mortimer, gr. to Major Storer, Wareley Park, 2d. There was also an amateurs' class for four plants, in which Mr. Hope, gr. to the Hon. K. Boyle, Furley, was the exhibitor.

The six Roses in pots shown by Mr. C. Turner, Slough, were a real surprise to the Reading people; they were of medium size and finely grown and flowered. Mr. Mould was 2d. Mr. Pound, gr. to G. May, jun., Esq., Cavesham, was 1st with three Orchids, which were very nice examples. The nine show Pelargoniums shown by Mr. Ashby, gr. to W. Fauning, Esq., Whitechurch, fully maintained the reputation of this exhibitor as a successful grower; Mr. Mortimer being 2d. Mr. Burgess, Esq., Colonel Clayton, was the only exhibitor of six varieties of Pelargoniums, staging small but clean and neat specimens. Gloxinias were splendidly grown and flowered, quite large, healthy specimens of fine quality, much in advance of what is usually seen. Messrs. Mortimer and Hope were severally 1st and 2d. Calceolarias, represented by Mrs. Bezzant, gr. to J. Simonds, Esq., were specially good. Mr. Burgess being 1st, and Mr. Lockie, gr. to Lord O. Fitzgerald, Windsor, 2d. A new class, for a group of Rhododendrons, brought two excellent groups, both a little too much crowded. Mr. Turton, gr. to J. Hargreaves, Esq., Ewelme, was 1st, with six varieties, only a little in advance of Mr. Ashby, who was 2d. Groups of plants arranged for effect were in the usual stereotyped form: Mr. Lees was 1st, and Mr. Bennett 2d. In the smaller group Mr. Pound was 1st, and Mr. Summer 2d.

In the class for four plants Mr. Tudgy staged some capital examples, Mr. Bennett being 2d. In the class for six foliage plants Mr. Tudgy was also well ahead, Mr. Mortimer came 2d, and Mr. Bezzant, gr. to H. J. Simonds, Esq., Cavesham, 3d. In the class for four plants Mr. Hope was 1st, staging a very fine plant of *Phlox paniculata* in flower. Mr. Bennett was 2d, and was in excellent condition generally, the best six coming from Mr. Mortimer, beating Mr. Tudgy, who had to be content with the 2d place. Mr. Bennett had the best four, Mr. Hope being 2d. Better plants of *Saxifraga hypnifolia* could scarcely have been shown. They are well done in the Reading district. Mr. Mortimer was as usual 1st, followed closely by Mr. Hope, who was placed 2d.

Miscellaneous exhibits included some plants of Roses in pots from Mr. Turner, some fine blooms of *Marshall Niel* Rose from Mr. Franter, Assenden, and a charming wreath of white flowers from Mr. G. Phippen, nurseryman, Reading.

Cut flowers were represented by Roses, some fine blooms coming from Mr. Turner and Mr. Lees; by excellent Pansies, both show and fancy; and by cut blooms of stove and greenhouse plants. Mr. Phippen had the best bridal bouquet.

The fruit classes were fairly well filled for the time of year. In the class for two bunches of black Grapes Mr. Ashby was 1st, with good Black Hamburgs; Mr. Atkins, The Gardens, Lockinge, being 2d, with Madrescourt Court. In the class for two bunches of white Grapes, Mr. Atkins was 1st, with Foster's Seedling, in excellent form; Mr. Ashby taking 2d place, with Buckland Sweetwater. Strawberries were very good. Some nice Peaches were shown by Mr. Ashby; and Mr. Howe,

Brisbane Park, had a good dish of Figs. Mr. Atkins staged some new Melons, to one of which, named Lockinge Conqueror, a scarlet-fleshed sort, a First-class Certificate was awarded. In the vegetable classes there was a good competition. A sufficient distinction between Cauliflowers and Broccoli is not made by some exhibitors. Early Potatoes were very good, Porter's Excelsior and Ashleaf taking the highest honours. A capital representative collection of vegetables, set up by Mr. Lockie, won the 1st prize in the miscellaneous class. For the special prizes offered by Messrs. Sutton & Sons for the best brace of Cucumbers, Mr. Lockie was 1st, with a pretty pair of Model, a selection from Telegraph; Mr. Miles coming next, with Improved Telegraph; and Mr. Mortimer 3d, with Model, all very good indeed.

Florists' Flowers.

THE TULIP.—The early flowering Tulips are now being very extensively grown both in public and private gardens; and this year they have been brought into more than usual prominence as decorative subjects for the greenhouse and the flower garden, and well adapted they are for either purpose. It is very singular that the late flowering section are to be seen nowhere in the South of England. We have a very good bed of choice sorts now in flower, and considering that the weather has been anything but favourable, they form a striking feature in the garden, many of the flowers being of the largest size and in their best character. One very interesting part of the Tulip fancier's pleasures is the anticipation of the self-flowers breaking into flame or feather. Mr. Barlow, of Stakehill House, with his wonted liberality was good enough to send me numerous examples of his best breeders four years ago, and during the intervening years most of them have become rectified flowers. The matching process begins as soon as the plants are above the ground; a self that is a "breeder" has the foliage of a deep glaucous green. If the flower has broken into its flamed or feathered character, the foliage will show it by being also marked with an indistinct variegation, and this will be observed in its very earliest stages. Although our plants were late in appearing above ground this year they are now fully in flower, and in looking over the collection the following are the best and most striking:—

BIZARRÉS.—George Hayward (Lawrence), finest in the feathered state, but it is also flamed. Dr. Hardy (Storer) we have no feathered form of this, but it is beautifully flamed with red. Another red variety, much like it, is also fine, Everard (Bowler); Masterpiece (Slater), flamed, but most refined as a feather; the colour is almost black on a rich golden-yellow; Sir Joseph Paxton (Willison) is really superb as a flamed flower, the marking being very regular. We do not have it in the feathered state, but it is also seen feathered.

BYLREMENS.—In this section I have been much interested in two flowers Mr. Barlow sent, viz., Mrs. Jackson and David Jackson; the first-named is a rather small flower, but very pure white with black flame. When David Jackson flowered for the first time it was in the breeder state, and the darkest I ever saw; they are now all broken, with the base of the cup pure white, the flower being heavily flamed with black. Talsiman (hardy) is of the same type, and is also finely flamed with black on a white ground. Alexander Magnus is a large, finely formed, feathered Tulip. Duchess of Sutherland (Walker) still forms a conspicuous ornament in the bed. Friar Tuck (Slater) is our largest flower this year, and is fine in the flamed and feathered state.

ROSES.—These are, I think, the most pleasing of all the sections. The different shades of rose and scarlet in flame or feather on a pure white ground seldom fails to please even those who are not up in the points not trained to criticise the standard of excellence. Industry (Lea), for instance, has now preeminence as the best feathered rose in any class. It is best described as carmine-scarlet on a pure white ground. Heroine, although an old flower, is the best on our bed at the present; the white is so pure, and the deep rose flame is very regularly disposed, flowers very large. Annie McGregor is very pretty, and Sarah Healdy is now in its best flamed state. Lady Sefton, dwarf plant, and very pretty flower. We have also Pretty Jane, Mabel, and Charmer feathered and flamed; they are very similar in character, and of a rich deep rose on pure white ground. *F. Douglas*,

- May 25.—A dull rainy day till 3 P.M., alternately clear and cloudy at night.
- 26.—A fine day, alternately clear and cloudy. Fine night, slight rain.
- 27.—A very fine bright day, sun shining brightly. Fine cold night.
- 28.—Very fine day. Very fine clear night.
- 29.—A very fine bright warm day, sun shining brightly. Fine calm warm night.
- 30.—A very fine day till 2 P.M., then cloudy and dull till 3 P.M. Fine night.
- 31.—A very fine bright warm day, alternately clear and cloudy. Fine night.

LONDON: Atmospheric Pressure.—During the week ending May 27 the reading of the barometer at the level of the sea increased from 29.87 inches at the beginning of the week to 29.96 inches by midnight on the 21st, decreased to 29.52 inches by midnight on the 23d, increased to 29.55 inches by 9 A.M. on the 24th, decreased to 29.48 inches by 3 P.M. on the 24th, increased to 29.53 inches by midnight on the same day, decreased to 29.36 inches by 9 A.M. on the 25th, and was 30.29 inches by the end of the week.

The mean reading for the week at the level of the sea was 29.76 inches, being 0.49 inch lower than last week, and 0.18 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 75° on the 22d. On the 23d the highest temperature was 56°. The mean of the seven high day temperatures was 59°.

The lowest temperature in the shade in the week was 48°, on the 21st and 22d; on the 23d the lowest temperature was 53°. The mean of the seven lowest temperatures was 50°.

The greatest range of temperature in one day was 27°, on the 22d; the smallest was 6°.

The mean of the seven daily ranges was 16°.

The mean temperatures were, on the 21st, 56°; on the 22d, 61°; on the 23d, 58°; on the 24th, 56°; on the 25th, 52°; on the 26th, 56°; on the 27th, 58°; 1/2 of these those of the 21st, 22d, 23d, 24th, 26th, and 27th were above their averages by 3°, 7°, 1°, 2°, 1°, 9°, and 3° respectively; and that of the 25th was below its average by 2°.

The mean temperature of the air for the week was 57°.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 147° on the 27th; the highest, on the 25th, was 77°.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 40° on the 21st. The mean of the seven readings was 44°.

Rain.—Rain fell on six days to the amount of 0.54 inch, of which 0.37 inch fell on the 25th.

ENGLAND: Temperature.—During the week ending May 27 the highest temperatures were 75° at Cambridge, 75° at Blackheath, and 73° at Sunderland. The highest temperature at Plymouth was 65°; at Hull 66°, and at Bristol 67°.

The general mean was 69°.

The lowest temperatures in the week were 38° at Cambridge and Hull, and 40° at Leicester.

lowest temperature at Brighton was 50°, at Plymouth 49°, and at Blackheath 48°. The general mean was 43°.7.

The greatest ranges of temperature in the week were 37°.7 at Cambridge, 36°.4 at Nottingham, and 30°. at Leicester. The least ranges were 16°.8 at Plymouth, 19°.8 at Brighton, and 20° at Truro. The general mean was 26°.2.

The mean of the seven high day temperatures was highest at Cambridge, 71°, at Sunderland 67°.4, and at Blackheath and Nottingham 67°; and was lowest at Plymouth, 62°.5, at Truro 63°, and at Bolton 63°.5. The general mean was 65°.2.

The mean of the seven lowest night temperatures was highest at Truro, 52°. at Plymouth and Brighton 51°.7; and was lowest at Cambridge, 45°.1, at Sunderland 46°, and at Nottingham 46°.1. The general mean was 48°.2.

The mean daily range was greatest at Cambridge, 25°.9, at Sunderland 21°.4, and at Nottingham 20°.9; and was least at Plymouth, 16°.8, at Truro 11°, and at Brighton 13°.9. The general mean was 17°.

The mean temperature for the week was highest at Blackheath, 57°.3, at Brighton 57°, and at Cambridge 56°.4; and was lowest at Bolton, 52°.3, and at Wolverhampton and Hull 53°.5. The general mean was 55°.

Rain.—The largest falls were 2.42 inches at Truro, 2.05 inch at Wolverhampton, and 1.25 inch at Bristol. The least falls were .51 inch at Liverpool, 0.53 inch at Bradford, and 0.54 inch at Blackheath. The general mean fall was .692 inch. Rain fell on every day in the week at Truro and Wolverhampton, and on five or six days at other stations.

SCOTLAND: Temperature.—During the week ending May 27 the highest temperature was 68°, at Paisley; at Edinburgh the highest temperature was 61°. The general mean was 65°.3.

The lowest temperature in the week was 38°, at Leith; at Edinburgh the lowest temperature was 42°.5. The general mean was 49°.

The mean temperature for the week was highest at Paisley, 54°.4; and lowest at Aberdeen, 51°.5. The general mean was 53°.1.

Rain.—The largest fall was 2.10 inches at Leith; the smallest was 0.32 inch at Edinburgh. The general average fall was 0.84 inch.

JAMES GLAISHER, F.R.S.

PLANT PORTRAITS.

CALYCANTHUS FLORIDUS, *Arboretum Segesianum*, t. xxiv.—A variety of the American shrub known in English gardens as the Carolina Allspice, and said to be harder than the type.

CRATEGUS COCCINEA var. CORDATA, *Arboret. Segesianum*, t. 23.—A medium-sized tree with greyish bark, scamy spines, cordate oblong dentate sublobed leaves and large oblong obtuse edible scarlet fruit. North America.

CRATEGUS LEOUPELLOS, Mönch, *Arboret. Segesianum*, *Icon*, t. 22.—A medium-sized tree, with spineless grey bark, ovate acute leaves, tapering at the base, margin toothed; corymb many flowered, fruits oval, scarlet, about ½ inch long. Eastern States of North America.

FORSYTHIAS.—The gayest of gay flowering shrubs at this season are the Forsythias. *F. suspensa* and *F. viridissima* are the two most commonly seen; the first has slender branches and a straggling habit, but with larger, clearer yellow flowers than the second, which is of more bushy habit. Both are very free flowering, quite hardy, and should be included in every garden.

PIEROCARYA FRAXINIFOLIA, *Arboret. Segesianum*, t. xxi.—A Caucasian tree with unequally pinnate leaves, oblong lanceolate serrulate leaflets, longest near the base, male and female catkins elongate, the fruits about the size of a pea with large oblong wings.

PIEROCARYA SPACHIANA, *Arboretum Segesianum*, t. xx.—A tree of medium height, with the habit of a Walnut, with unequally pinnate leaves, the leaflets largest at the base of lanceolate serrate male and female catkins on the same tree, slender elongated fruits arranged along a long axis, each about the size of a small hazel-nut, sub-globose, woody, with a conical style and two membranous roundish wings.

PIEROCARYA STENOPIERA, *Arboretum Segesianum*, t. lxx.—A lofty Chinese tree, with unequally pinnate foliage, the pinnæ in six or seven pairs, oblong obtuse serrulate, those in the centre of each leaf longish, rachis of leaf winged, male catkins relatively short, female catkins long; fruit the size of a large pea, with two long membranous wings like the keys of a Maple.

Obituary.

We regret to learn from the *Kelso Chronicle* of the death, on May 25, aged sixty-two years, of Mr. GEORGE WEMYSS, gardener and estate superintendent to Sir G. H. Scott Douglas, Bart., at Springwood Park, Kelso, in whose service he had been for thirty years. The deceased, who was a native of Heiton, commenced his gardening career at Floors Castle, where he received a capital training under Mr. Craig Pillans. He was from his institution a prominent worker of the Kelso Horticultural Society, and was the founder, and as long as it lasted the moving spirit, of a useful club, whose object was to induce gardeners to meet together, and bring what of their produce they thought fit to show to their fellow-workers. His personal aid, and the benefit of his experience, were always at the disposal of horticultural societies, at which he was a frequent and valued judge. Many years ago he contributed extensively to horticultural periodicals, as also to journals on forestry and agriculture. An evidence of Mr. Wemyss' high professional qualifications is found in his appointment by the Kelso Analytical Association as their official tester of seeds—which is one of the objects which the Association was formed to undertake. Mr. Wemyss had a competent knowledge of meteorology, and was a careful observer and recorder.

—A Lisbon correspondent writes:—I have the sad duty to ask you to announce in the *Gardeners' Chronicle* the death, on the morning of May 24, of Mr. JAMES N. WILSON, of the firm of Wilson & Co., fruit merchants, Covent Garden, London. He has for many years successfully carried out the cultivation of fruits and vegetables on English principles in this country, and his loss is severely felt by his friends here, both English and Portuguese.

Answers to Correspondents.

CARNATION THE GOVERNOR: H. J. Cross & Steer. Your white Carnation, The Governor, has a good pod, and is a very good flower, but its value depends much upon the habit of the plant, of which we know nothing.

CUTTINGS LAWSONIANA: J. H. The best time to cut off the tops would be in the spring, just before the trees commence to make their season's growth.

DEER DROPPINGS: H. Ellridge. Deer-manure, liquid or solid, is only injurious to vegetation, like any other animal, when it is applied too liberally, or at a time when the plant cannot use it. In a well-diluted liquid form it is one of those safe and mild stimulants that any one can be entrusted to use, and with the certainty of doing good.

DIGITALIS: H. J. R., Florence.—Such information is never infrequent, and have often been figured in our columns. We take it that something checks the growth in length at the tip of the inflorescence; as a consequence, several flowers run one into the other, and ultimately form a large erect cup, as in your specimen. The change must, of course, take place when the inflorescence is in an embryonic condition.

ENIGMATIC PLANTS: B. Iris pumila makes an excellent edging, and the flowers in spring are very attractive. The common Thrift is also excellent, and in places where it is likely to succeed nothing is more beautiful than *Gentiana acialis*.

ERRATUM.—At p. 703, col. c, sixth line from the bottom, for "admitted" read "omitted".

FALSE ADVERTISEMENTS: W. Howd. Unless you state the exact circumstances of the case we cannot give you an answer.

GALVANISED WIRE: C. L. P. Painting the wires is an essential remedy.

MAKING-UP SPECIMENS: Dabbie. Some judges, if they found that the specimens had been made up even before the season's growth commenced, would object to them, but others would not. In the case of all plants that admit of subdivision the practice of making up specimens will be carried out by some exhibitors, and it will done if they are difficult to be dealt with by judges; for our own part, we strongly object to it, but we think the schedule should contain some statement as to the point to guide exhibitors and judges.

MARCHEL NIEL ROSE: R. K. P. Marchel Niel, either on its own roots or grafted, is a short-lived plant, almost invariably forming a large excrescence just above the union of the graft, or just above the surface of the ground in the case of those on their own roots, which brings about their gradual destruction. If examined your plant will probably be found similarly affected. To keep Marchel Niel going young plants must be put in from time to time.

MONSTERA DELICIOSA: H. Louth. Keep up as much heat as you have found to suit the plant up to this time, but keep the atmosphere a little drier. The whole flower-spike is turned into one succulent fruit,

beneath the thick rind of which, however, are a number of very minute needle-like crystals which prick the tongue. To avoid this the best plan is to take a quill, or a glass tube, thrust it beneath the rind, and then suck up the juice, which, if the fruit be thoroughly ripe, is of a delicious flavour.

NAMES OF PLANTS: H. F. Ross. Your *Dendrobium Parishii* is not *rhodopetaleum*, but a pallid variety only. Please send a bulb and a leaf, both old and dead ones of the Era. If you think it more convenient, let them go first to London. *H. G. Koch*, f. — *A. V. Z.* Probably the Fallum (Oak) a hybrid between the Turkey and Cork Oaks, but we cannot say for certain from such a small specimen. *F. W. R.* 1, *Reseda lutea*; 2, *Fabiana umbriata*; 3, *Asclepias curassavica*; 4, *Wegelea rosea*; 5, an evergreen Oak, like the *Quercus* of the Fallum or the Luteo, which we do not recognise from the specimen sent. — *R. C. Bell*, *Calycauthus floridus*, the Carolina Allspice. — *A. D.* 1, *Gemisa anglica*; 2, *Pedicularis silvatica*; 3, *Viola palustris*; 4, *Potamogeton natans*; 5, *Potamogeton prolapsus*; 6, *Potamogeton lucens*; 7, *Allium unguicula*. Next time please pay your letter. — *R. C. B.* A. *Antennaria dioica*, male; B. *A. dioica*, female. — *H. Moore*, *Olearia nuda*. — *H. King*, *Berberis Wallichiana*. — *A Constant Sub.* 1, *Nicotiana glauca*; 2, *Callistemon lanceolatus*. *T. F.* *Heuchera americana*, and *Salvia nemoralis* plants. — *J. G.* *Junonia confusum*; 2, *Streptocarpus Gardenii*; 3, *Junonia confusa* (syn. *Cynthera Pohlmanii*). — *S. G. L.* *Hura crepitans* (the Sand-box tree). — *C. E. F.* *Serapias pseudo-cordigera*. — *C. D.* *Al. Kirp.* Not the *Yucca Asplenium*, but a form of the common *Laurus thalictaria*.

PEAT MOSS: *Gambie*. The peatmoss best becomes when wet little better than sponge, and is quite useless for plant culture except as drainage. If used as bedding in the stables or piggeries it acts as an absorbent, and then becomes valuable as a manure for garden or lawn.

SEEDLING PANSETTES: *Domick & Laird*. The seedling plants favoured are remarkable for their great size and rich and well-varied colouring, and are mostly of good form also.

SMALL GREENHOUSES: *Knoxbullunder*. We would advise you, if you have no experience in plant growing, to commence with such things as greenhouse Ferns, which may be mixed with advantage with the finer British species. To these you may add greenhouse Palms, and any other choice plants in pots. Just as will stand a greenhouse temperature. Then by degrees you can try your hand on the summer cultivation of *Pelargonium*, *Fuchsia*, *Balsam*, *Musk*, and such like soft-wooded things, as your fancy may dictate. The best shading would be "Summer Cloud" put on now and washed off in the autumn.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editor," and not to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

SEEDS.

LONDON: May 21.—Messrs. J. Shaw & Sons, of 371 Mark Lane, write that the seed market to-day presented quite a holiday character, and the business done was as nearly nil as possible.

CORN.

Monday being a Bank Holiday, there was no business done at Mark Lane.—On Wednesday but little English Wheat was on offer; good red qualities were steady.

CATTLE.

At Copenhagen Fields on Monday fair supplies in the best market met a rather irregular sale, from previous rates to occasionally rather less money.

HAY.

Tuesday's Whitechapel Market report states that prices were steady, with moderate supplies, but the trade was dull.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies continue good and the trade quiet.

GARDEN REQUISITES.

COCOA-NUT FIBRE REFUSE. 3 lb per bushel; 100 for 20; truck (close about 6 tons), 30s; 4 bushel bags, 4s each.

COCOA-NUT FIBRE REFUSE, by Chubb's Patent Process, as supplied to all the Royal Gardens and principal Nurseries of Europe.

COCOA-NUT FIBRE REFUSE, the best for all purposes (all fresh) is supplied to the Royal Horticultural Society and principal Nurseries in England.

COCOA-NUT FIBRE REFUSE, pure only, 4 bushel bag, 15s; 12 bags, 165s; 30 bags, 435s; sent to all parts.

LOAM, splendid Yellow Fibrous, 15s, 6d per ton. Good useful brownPEAT, 22s, 6d per ton.

FIRST-CLASS KENTISH PEAT FOR SALE.—Ten cubic yards, £4. 15 cubic yards, £6.

12-oz. Sample Packets, free by post, 12 stamps. FIBROUS PEAT FOR ORCHIDS, &c.—BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c.

Thomson's Vine and Plant Manure. Manufactured and Sold by THE LIVERPOOL HORTICULTURAL COMPANY.

All this Manure used to produce the splendid Grapes grown at the Twced Vineyard, Clovenfords.

Full particulars on application. The Trade supplied.

All Letters to be addressed to THE MANAGER, The Vineyard and Nursery, Garston, near Liverpool.

WEEDES, HOW TO DESTROY THEM. Use WILKIN'S celebrated WEEED KILLER, 4 gallons of which, sufficient to make 100 gallons when mixed with cold water.

ROLL TOBACCO PAPER CLOTH, and FIBRE for Fumigating.

The best and strongest it is possible to obtain. 7 lbs, 4s, 6d; 14 lbs, 7s, 6d; 28 lbs, 12s, 6d.

DARLINGTON BROS., Frederick Street, Chatham. Post-office Orders and Cheques, Harburgton Bk., Chatham.

GISHURST COMPOUND.—Used by many of the leading Gardeners, since 1850, against Rod-sucker, Mildew, Thrush, Greyness, and other Blights.

AMERICAN BLIGHT ON APPLE TREES CURED by rubbing a wet hard Painter's brush on Gishurst Compound, and working the latter into the infected part.

GISHURSTINE keeps feet dry, softens hard boots, preserves leather, takes a polish. In boxes, 6d and 1s each.

DENNY'S Unrivalled ROLL PAPER and CLOTH, as supplied to over 200 Nurseries, 14 lb, 9s; 28 lb, 15s; 56 lb, 27s; 70 lb, 3s.

ARCHANGEL and ST. PETERSBURG NETTING, SACKS, FIBRE BAGS and SACKS, NETTING and SHADING, &c.

MARQUEES and TENTS, SECOND-HAND GOVERNMENT TENTS, 12 feet 19 inch, complete, 35s, suitable for the Garden, Cricket Clubs, &c.

ADIE'S PATENT LAWN EDGER.

THIS Machine constantly employed will pay itself in two days. Dr. Hogg, in the *Journal of Horticulture*, says—"This Edger Clipper we have tried, and know not which to admire most—its simplicity or efficiency." Mr. Moore, in the *Field*—"This new machine does its work rapidly and admirably, the grass being cut with precision, and" he further adds, "the use of it will, we have no doubt, become general." Price 50s.
PALL MALL LAWN EDGER CO., 15, Pall Mall, London, W.

FOSTER & PEARSON, BEESTON, NOTTS.

NEW IMPROVED FRAME, AWARDED Silver Medal by Royal Horticultural Society. See "*Gardener's Chronicle*," June 26.

FROM THE "GARDENERS' CHRONICLE"

PRICE LIST on application. CATALOGUES, 1s each. Established 1841.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the inventors, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale.

UNSOLICITED TESTIMONIAL. "Pierceland Park, June 21, 1876.—Sirs—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good varnish as the lot we had, which I candidly admit was the best we ever had.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 115, Queen Victoria Street, London, E.C.; and 130, Buchanan Street, Glasgow.

"THE COVENTRY."
(REGISTERED).

NETTLEFOLD & SONS desire to call especial attention to their "COVENTRY" LAWN MOWER, which they can confidently recommend as the best and cheapest in the Market. It has all the improvements which have of late been introduced into this class of Machine, either in England or America; and for the manner in which it does its work, its lightness, and the ease with which it can be used, cannot be surpassed. Its cheapness brings it within the reach of every one, and in this respect it defies competition with any American machine before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with **ROLLERS AT SAME PRICE, and GRASS BOXES** at a small extra cost.

MANUFACTURED BY

EPPS'S COCOA. GRATEFUL AND COMFORTING. Made simply with boiling water or milk. Sold only in packets, labelled. JAMES EPPS and CO., HOMEOPATHIC CHEMISTS, London. Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S OINTMENT and PILLS effect wonderful cures of Bad Legs and Old Wounds. This ointment is a true "detestable" and these Pills are true "alteratives." If they be used according to the directions which are wrapped round each pot and box, there is no Wound or Ulcer, however obstinate, but will yield to their curative properties. Numbers of persons who have been patients in the large hospitals, and under the care of eminent surgeons, without deriving the least benefit, have been cured by Holloway's Ointment and Pills, when other remedies had signally failed. For Glandular Swellings and Diseases of the Skin there are no remedies that can be used so safely and so successfully. If they are yet powerful; and though the cure they effect is rapid, it is also complete and permanent.

SEND FOR A PRICE LIST OF

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS

For Raising Water for the Supply of Towns, Villages, Irrigation,
Railway Stations, Mansions, Fountains, Farms.

No Cost for Motive Power, which is obtained from the stream of water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in Sizes to raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

Special Rams for High Falls to send up Two Gallons out of every Five Gallons passing through them.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

F. E. Eastwood, Esq., Eaton Park, Witley, Surrey.
F. Jackson, Esq., Marlesfield.
E. H. Nicholson, Esq., Beech Hill, Londonderry.

TESTIMONIALS.

From J. SPENNER CLAY, Esq., Ford Manor, Lingfield, Surrey, August 9, 1880.

"In reply to your letter of inquiry, I am glad to be able to say that the two Hydraulic Rams which you fixed here are working satisfactorily, and that out of 13 gallons 3 quarts per minute, the maximum yield of the spring, they deliver to the top of my house, distant a full mile from the spring, 4 gallons a quart per minute, or 6222 gallons per twenty-four hours, being 120 gallons above the quantity you guaranteed."

From Captain TOWNSEND, Wincanton, February 10, 1877.

"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

From the Rt. Hon. the Earl of ROMNEY, 56, Eaton Place, S.W., June 12, 1880.

"Sir,—In reply to your inquiry, I have pleasure in stating that the Hydraulic Ram which you erected for me at Craydon does its work remarkably well, and is a great success. I think the work is especially creditable to you on account of the very small fall of but 3 ft. with which you had to deal, and I shall always be glad to recommend you.—Yours faithfully,
ROMNEY.

From Captain GANDY, Castle Bank, Appleby, February 11, 1880.

"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with a 4 ft. 4 in. fall, it forces water 73 ft. high, and 80 far gives me every satisfaction. It will do its work in one day that the old Ram of another make could do in a week."

From V. F. BENNET-STANFORD, Esq., M. P., Pyl House, Tisbury, Wilts, August 20, 1880.

"I have no hesitation in saying your self-acting Hydraulic Ram, and apparatus for extinguishing fire, which you had down here, including about one mile of pipes, are very satisfactory. The Ram forces upwards of 6000 gallons per day to a service reservoir holding 25,000 gallons at an elevation of 200 feet, being 70 feet above the roof of the house, from which reservoir the water is distributed to the house, stables, home farm, and several cottages; and in case of fire, four jets can be thrown on the house from different points at a great force, and large volume. I consider your work has been done well and efficiently, and does you credit."

From the Rt. Hon. the Earl of GRANARD, Castle Forbes, March 1, 1880.

"The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of the tower 56 ft. high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground; but I have been most agreeably undeceived."

From Sir ROBERT MENZIES, Bart., of Menzies, Rannoch Lodge, Rannoch, August 20, 1880.

"The Hydraulic Ram you fixed for me to supply water to Rannoch Lodge and Camerich, two houses three quarters of a mile apart, is a complete success. The extreme distance the water is carried is 1 mile, and though the elevations of the two houses are different, there is a regular supply of seven quarts per minute to each house, which has never ceased since the Ram was set a-going, about three months ago. Your Ram took the place of one previously tried on the same spot, which did not succeed, and was in fact a complete failure."

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.

NURSERY AND MARKET GARDEN.

Stock by Valuation. Any one with £200 to £400 would be liberally dealt with. J. A. P. Gardener's Chronicle Office, W.C.

Florists and Nurserymen - Splendid Opening.

TO BE LET, on a N.E. LEASE, cheap, a NURSERY, about 1/2 Acre, with 12000 feet of Glass, in capital working order. Well stocked. Good connection. Six miles from Covent Garden. M. CHAPMAN, Bedford Hill Nursery, Balham, S.W.

TO BE LET, as a Going Concern, on September 1, 1882, if desired, a compact NURSERY and small SEED BUSINESS, situated in the best position of Staffordshire, comprising about 2 Acres of well-selected Nursery Stock, also 3 Acres of old Farm Land, and a Dwelling House, a large stock of Hollies in variety, which will well serve, as does all other Nursery Stock, the Soil being deep Loam, and a never-failing supply of water on the ground. It has been established nearly sixty years, and declining health is the sole cause of disposing of it. For particulars address R. S., Robert Cooper, Esq., Seed Merchant, 90, Southwark Street, London, S. E.

TO BE LET, about 17 Acres of good MEADOW LAND, in first-rate condition, comprising Fields, and Garden, with excellent Fences, and well watered. There are Sheds and Cow-houses, and also Cottage containing three Bed Rooms, Sitting-room, Kitchen, Scullery, &c., in a high state of repair. To let on long lease, or to be purchased. Apply to J. H. HART & SON, 152, Houndsditch, E. or to J. H. HART & SON, 152, Houndsditch, E.

Florist and Seedsman's, with Fruit, &c. TO BE LET, a capital HOUSE, SHOP, and BUSINESS. Incoming low, long lease, good trade, main road, S.E. - Particulars of FLORENTI, 80, St. Paul's Churchyard, E.C.

PROTHEROE AND MORRIS, HORTICULTURAL MARKET GARDEN AND EXOTIC PLANTERS and VALBERS, 8, New Broad Street, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

DOUBLE PRIMULA - Strong plants,

ready for first shift, 50s. per 100 for cash; also well-rooted BOURBON PRIMULAS, 20s. per 100. ROBERTS BROS., Arnold, East Grinstead.

MANSSION HOUSE, LONDON.

Grand Rose Show

WILL BE HELD AT THE MANSSION HOUSE,

ON FRIDAY, JUNE 30, 1882,

IN AID OF THE FUNDS OF THE ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO BRIDGE ROAD,

AND THE Convalescent Home for Scarlet Fever Patients.

The Exhibition, which will be arranged by Mr. J. Forsyth Johnson, Horticultural Director of the Alexandra Palace, will consist of 10,000 ROSES from the gardens of the principal growers, arranged with Ferns and other accessories in an artistic manner, and of a Competition confined to Amateur Growers.

All Roses to be grown by Exhibitor, and exhibited in boxes to be shown as cut from the tree. Any buds and leaves may be left, but no loose leaves to be added. Added foliage will be disqualified.

All the exhibited Roses, unless reserved, will be sold at fixed prices, and delivered at the close of the Show, at 7 o'clock. All exhibitors to be ready for judging by 10.30, or they will not be eligible for competition.

Entries to be made on or before June 27, addressed to the Secretary, Mansion House.

- CLASS I. 24 ELOOMS, named, distinct - single.
- CLASS II. 12 ELOOMS, named, distinct - single.
- CLASS III. 12 HYBRID BLOOMS, named, distinct - three of each.

BY H. J. LOMANS, Florist, Haarlem, Holland, with ordinary care and attention, produces most satisfactory results. Copies of testimonials will be found in the Seed CATALOGUE for 1882, which will be sent post-free to all applications.

Novelty.

GRAND NEW BEDDING PLANT. LOBELIA ANDREAE HOLMES. This splendid variety is now offered as the best Lobelia extant. It is possessed of a hardy growth, compact, cushion-like habit, and excessive floriferousness, combined with the intense deep blue coloring, makes the well-known variety "Ebor" remarkable, being, at the same time, a small, well-defined white eye, being lighter and of much even growth than that variety, and striking in its tenderness. Confidently recommended by its raiser, who is now distributing it, as superior to every kind cultivated. The following testimonial is from Mr. J. FIELDS, Head Gardener to the Yorkshire Philosophical Society: "The Museum Holmes I consider to be the forefront of the many really good Lobelias now before the public. It has the compact habit, very floriferous, and in colour not unlike Gentiana verna, one of our loveliest alpine gems, and must soon become a popular favourite." J. FIELDS.

Price 1s. each, 9s. per dozen, 60s. per 100. The usual discount to the Trade. GEORGE HOLMES, Florist, York. SPECIAL CHEAP OFFER. LOBELIA SPECIOSA and BLUE STONE, from cuttings, 2s. 6d. per 100; 20s. per 1000; 8s. per dozen. GERANIUMS, Scarlet and Rose, 7s. per 100; 1s. 6d. per sample dozen; Tricolor Italia Unita and Glen Eyre Begonia, 16s. per 100; 2s. 6d. per dozen. IRESINE, 6s. per 100; 1s. 2d. per dozen. HELIOTROPES, 6s. per 100; 1s. 2d. per dozen. GOLEDS, eighteen varieties, 12s. per 100; 2s. per dozen. CHRYSANTHEMUMS, best varieties, 4s. per 100; 1s. 1d. per dozen. FUCHSIAS, all the leading varieties, 6s. per 100; newer varieties, 8s. per 100; 1s. 2d. and 1s. 6d. per dozen. VEREENAS, Purple, White, Crimson, Pink, Red, and Scarlet, 6s. per 100; 50s. per 1000; 1s. 2d. per dozen. GOLDEN LEAFED PEUNIAS, 2s. 6d. per 100. Sample dozen post-free, other package free. Cash with all orders. T. FLETCHER and SON, Florists, &c., Chesterfield.

One Dozen of Each for 21s. GOOD VALUE FOR MONEY. Only the best grown, all true to name, and strong Plants. 12 choice splendid ZONAL GERANIUMS for 31s. 50 for 10s. 12 choice splendid BRONZE GERANIUMS for 3s. 6d., 50 for 12s. 12 choice splendid DAHLIAS, 6s., 100 for 20s. 12 choice splendid GOLDEN TRICOLORS for 3s. 6d. 12 choice named PHLOX for 3s. 6d. 12 choice Silver-gold FANCY FLOWERING GERANIUMS 12 choice named Single PEUNIAS, 2s. 6d. (10s. 2s.) See Descriptive CATALOGUE. Cash with order. Package free. They are honestly worth double the amount. The plants are ready for every district. CHARLES BURLEY, Brentwood, Nurseries.

Thursday Next, June 15.

GREAT CATTLEYA SALE.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, June 15, at half-past 12 o'Clock precisely, an Importation of

CATTLEYA SANDERIANA,

grand masses of this gigantic and noble CATTLEYA; a splendid consignment of CATTLEYA GIGAS and TRIANE, a NEW CATTLEYA, provisionally named ROTHSCHILDIANA; many other CATTLEYAS, and LÆLIA MILTONIA, MORELIANA, and REGNELII; a grand lot of CHYSIS BRACTESCENS, in perfect condition; together with many other ORCHIDS, including several enormous masses of LÆLIA ANCEPS, darkest variety; LÆLIA ALBIDA MAJOR, IONOPSIS PANICULATA, ODONTOGLOSSUM ALEXANDRÆ, LÆLIA ELEGANS, &c.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

CALCEOLARIA "CLOTH OF GOLD."

LET WHATEVER MAY BE ASSERTED, we last season bought the actual plant of the above exhibited by Mr. Ranley, and certified by the Royal Horticultural and other Societies, also about two dozen young plants. Of these we have some now in bloom. We also purchased other choice kinds of him, so that our collection should be the most perfect, and from all of which we are picking a splendid lot of really good hybridized seed, and offering the same in 2s. 6d. packets with our other superb varieties. It is therefore obvious that we, and we only, can offer NEW SEED of the true certified plant the only Calceolaria of that name awarded a First-class Certificate, and in August we hope to offer some thousands of plants from self-sown seed of it, and all our unrivalled kinds, at 2s. per dozen, 12s. per 100. Our 100-foot home, specially allotted to their culture all the year round, has been for the last six weeks unquestionably one of the finest sights and the most complete collection ever seen of this family.

GRASS SEEDS FOR LAWNS.

Of the finest close-growing Evergreen kinds, 1s. per lb. Special preparations for all purposes, soils, and situations. Advice gratis.

Unsolicited Testimonials:—"Knowing how difficult it is to obtain pure stocks of grass seeds, even when price is a secondary consideration, I wrote to say the supply I obtained from you for our new terrace lawns has given the greatest satisfaction."
"Please send me three bushels of the very best Lawn Grass Seeds, suitable for an exceedingly hot upland soil."
"The seed I have had of you has been the only kind which has been able to resist the influence of the sun and drought upon my turf, gravelly soil."

FARM SEEDS

Of all kinds, which have given unequalled satisfaction. See Illustrated and Descriptive LIST free on application.

UNSURPASSED FLOWER and VEGETABLE SEEDS. LIST Free by Post.

(REGISTERED.) Hydro-Carbon Oils as Insecticides and Washes for Plants and Animals.

SOLUBLE FIR TREE OIL INSECTICIDE.

Bottles, 1s. 6d., 2s. 6d., 4s. 6d., and 7s. 6d.; Gallons, 12s. 6d.; Casks, 11s. per gallon. It destroys all insect pests on plants and fruit trees, whether at the roots or on the foliage. It destroys all parasites and fungoids which infest animals and human beings. It is free from poison, very clean and pleasant in the using. It is the cheapest insecticide ever produced.

Testimonial. Wiltshire Gardens, February 15, 1882. Mr. HUGHES.—Sir,—Please send me at once 1 gallon Fir Tree Oil, I have again tried the above, and believe it to be what has been said of it. My previous disappointment with it was on account of its not being stirred sufficiently.—Yours, &c., JAS. TISSINGTON.

From all Seedsmen and Chemists. Manufactured by E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.

WEEDS, HOW TO DESTROY THEM.

Use SMITH'S celebrated WEED KILLER, 4 gallons of which, sufficient to make 100 gallons when mixed with cold water, sent in a sample, carriage paid, price 7s. 6d. Thoroughly destructive to all vegetable growth. Manufactured only by MARK SMITH, Chemist, Louth, Lincolnshire.

DANIELS'
CHOICE STRAINS OF
FLORISTS' FLOWER SEEDS,
For Present Sowing, Post-free.

NOTE In the Raising of Florists' Flowers from Seed, the first essential point is to secure carefully Hybridized Seed, saved from the finest flowers of the finest kinds, the choicest of strains in raising some really good varieties being trawly greater from a few plants from seed of the choicest quality than from a large quantity raised from seed of an inferior description.

EXHIBITION OF ORCHIDS.

B. S. WILLIAMS

Has much pleasure in announcing that he has determined to make a grand show of his flowering ORCHIDS at home. The Exhibition will include, in addition to the usual stock of young Flowering Plants, all the grand specimens that he has been in the habit of including in his Collections, which have obtained the leading prizes for many years both at home and abroad.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition will contain large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LELIAS, ONCIDIUMS, CYPRIPEDIUMS, MASDEVALLIAS, VANDAS, AERIDES, SACCOLABIUMS, and other rare and showy ORCHIDS.

AN EARLY INSPECTION IS RESPECTFULLY INVITED.
NO CARDS TO VIEW REQUIRED.

A hearty welcome will be given to all who honour us with a visit.

CARRIAGE ROUTE.

Carriage Route from the West End is through Albany Street, Regent's Park, Park Street, Camden Town, Kentish Town, and Junction Road.

The North Metropolitan Tramway Cars, in addition to the Street Tramways Company's Cars, arrive at and start from the Nurseries, for the City and West End, every few minutes.

The Great Northern Main Line trains all stop at Holloway Station, which is within fifteen minutes' walk of the Nurseries. The Midland and Great Eastern Main Line trains all stop at Kentish Town Station, which is within ten minutes' walk of the Nurseries. The Midland, in connection with the Metropolitan Railway, runs frequent Trains during the day from all parts of London to Upper Holloway Station, which is within three minutes' walk of the Nurseries.

VICTORIA AND PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

NOTICE.

MR. WILLIAM BARRON,
the experienced and well known Land-
scape Gardener and Horticultural Builder, of
Sketty, Swansea, wishes it to be clearly understood
that his Establishment, of more than 100 acres,

CONTINUES IN SOUTH WALES,

where it has been for more than 30 years. He
has no branch Nursery at a place called "Borrow-
ash," nor is he "related to nor connected with"
any other Firm.

Mr. WILLIAM BARRON Designed and
Built the magnificent Conservatories, Winter
Gardens, Vineries, Forcing Houses, &c., Kitchen
Gardens, Terraces, &c., for MADAME
ADELINA PATTI, at Craig-y-nos Castle, and
continues to carry out the necessary work.

Dated June 6, 1882.

THE
Gardeners' Chronicle.

SATURDAY, JUNE 10, 1882.

THE MARIANNE NORTH GAL-
LERY AT KEW.

FROM the present time the beautiful and
instructive series of oil paintings of plants
and their homes, made by Miss Marianne
North, in many different and distant parts of
the world, will be accessible to the public at all
times when the Royal Gardens at Kew are
publicly open. There are in this unique col-
lection no less than 627 oil paintings of plants,
and landscapes in which plants form a prominent
part. An excellent catalogue has been compiled
by Mr. W. B. Hemsley, and of this admirable
little handbook it would be almost impossible
to speak too highly. It has 131 pages
and will be sold for sixpence; it not only con-
tains all that Miss North knows about the sub-
jects and places painted, but it gives the popular
and botanical names of nearly every bloom and
fruit portrayed in the pictures. Sir Joseph
Hooker has also aided in the preparation of
this little work; Prof. Oliver, Mr. J. G.
Baker, Mr. J. R. Jackson, have also helped
in its preparation; and Mr. F. Du Cane God-
man, F.R.S., Mr. O. Salvin, F.R.S., and the
Rev. — Cambridge, have assisted in naming
the numerous birds, butterflies, spiders, &c.,
which find a place in some of the pictures.
Under the letter A only in the index there
are no fewer than 103 entries of plant names,
so that it is no exaggeration to say that a
visit to this collection of pictures, aided by
Mr. Hemsley's catalogue, gives the visitor an
opportunity of acquiring a good idea of the
natural vegetation of the greater part of the
world. Such an adjunct to a botanic garden is
unique, and in the highest degree valuable, for
it must be remembered that botanical drawings
seldom or never give life-like representations of
plant life, habit, and natural surroundings: it is
often impossible and generally unnecessary to
do this in purely scientific work. It is impos-
sible for any person who has not travelled
in the tropics to form any idea of what
tropical fruits like, botanical drawings
and sections give a poor idea, and photo-
graphs and miscellany samples in bottles of
spirit a still worse one, but here in this noble
collection of oil-colour sketches the innumerable
fruits of foreign countries are presented in such
large numbers and dashed off with such bold
and truthful drawing and colouring that the
fruits themselves seem to be before the visitor
in a living way. The arachnids, snakes, and
snails were seen near the objects represented
they have been invariably painted, and when
butterflies and birds have fluttered about flowers
they have been painted with equal truth with
the flowers themselves, so that not only have
botanists been easily able to name nearly all
the plants represented, but zoologists have been
able to name the birds and other animals, and
entomologists to do the same for the insects.
Some of the plants represented (like the mag-
nificent Nephentes Northiana, figured from Miss
North's drawing in our number for Dec. 3 last)
are new both to horticulturists and botanists. Mr.

Baker has quite recently described a handsome new Crinum, under the name of *C. Northianum*, in these pages; and it is quite evident, on an examination of other of the paintings, that there are several handsome and remarkable plants here represented that are at present unknown both in gardens and herbaria.

All the pictures are in oils, and taken from Nature in the homes of the plants; they are painted upon prepared paper, and affixed to canvas on reaching England. Little or no "medium" was (as we are informed by Miss North) used with the colours; but the tints were used just as they were pressed out of the metal tubes, no turpentine was used for cleaning the brushes, these were merely wiped or squeezed clean with a piece of rag. The pictures were, of course, executed under great difficulties, and often with insufficient or imperfect materials; sometimes the prepared paper ran so short that pictures had to be painted on both sides. Being in oils they had commonly to be packed up whilst still wet, and in this condition transported from place to place, so that our readers will see the works were produced under circumstances of no ordinary difficulty. No attempt is made at over-refinement in any of the works; high finish and minute details would have been impossible under the conditions, and no such details were requisite; they can be got, if wanted, from botanical and entomological books. The pictures have not even been varnished. They are the skillful, dashing works of a true artist, which completely succeed in showing us Nature as she is. A large collection of Miss North's pictures was exhibited at South Kensington a few years ago, but the present pictures are more numerous, as the Australian and New Zealand sketches are of quite recent date.

The pictures are arranged geographically, in the following order:—Teneriffe, Brazil, Jamaica, United States, California, Ceylon, India (with a series of sacred plants of the Hindus), Singapore, Borneo, Java, Japan, New Zealand, and Australia. In the pictures a great number of timber trees are portrayed, and the whole dodo of the room is made up of polished specimens of the woods derived from the trees sketched above. As far as possible each example of wood is named. The catalogue has also been cut up, framed and glazed in pages, and hung under the pictures, so that every person who desires to see and learn may do so if he pleases without the expenditure of a penny.

The pictures being all painted by the same hand, and in the same style, any criticism in detail is unnecessary; we may say of them, one and all, that they are well done, and thoroughly answer the purpose the artist undoubtedly set herself when she essayed to paint so many pictures of plant life in so many parts of the world. We mention a few of the pictures which especially attracted our attention as they lay in the room, and the list will be found at a distance an idea of the range of subjects: 2, Tobacco; 3, Olives; 5, the Cochinal garden of Teneriffe; 6, 10, 12, and 37, Dragon trees; 17, *Pomegranate*; 26, Harvesting Sugar-cane; 28, Orchids growing on water-worn boulders; 31, Brazilian Orchid, *Sophronites*—remarkable contrast of the fiery crimson blooms against the contrast of the green leaves and black-grey tree-trunk; 33, *Orchis canariensis*; 34, Houseleek and canary-birds, Teneriffe, the canaries the same colour as the Houseleek blooms; 40, Sugar-loaf Mountain, with inverted stork feeding on Trumpet tree; 41, Sago-yielding Cycads; 42, Fruits and vegetables of Brazil; 43, Granite boulders and Cuscuta; 44, House-builder caterpillar; 51, Flowers and fruit of *Maricopa's* Passion-flower; 52, Botanic Garden, Teneriffe; 55, Indata Palm; 56, Hemantibus, coral snake and spider; the correct drawing of the coiled snake and spider; the power of the artist. 60, Red and white Indian Water Lilies; 61, *Datura arifera* and humming-birds; 62, Palm trees and boulders, Rio; 64, Landscape at Morro Velho, Brazil, with a colony of butterflies, the habit of the latter being remarkably life-

like; 74, *Poinsettia pulcherrima*, apparently the "double," recently introduced into our nurseries; such an inflorescence as here painted is seldom seen in our gardens. 78, Foliage and fruit of Mamme Apple; 80, Screw Pines, Botanic Gardens, Brazil; 90, Wild meadow flowers, Brazil; 93, Old gold works, Brazil; 95, Brazilian flowers; 99, Side avenue of Royal Palms, with a man carrying a leaf, about 15 feet long, on his head; 102, Flowers of a Brazilian forest tree; 103, Peaches and humming birds; 105, Papaw trees; 111, Foliage and flowers of *Chorisia* and double-crested humming-birds; 112 and 114, Flowers of Coral tree and king of the flycatchers; 115, Castor-oil plant; 116, a Brazilian Orchid—*Lelia parparata*; 118, Flowers, foliage, and fruit of the Sour-sop; 120, Brazilian flowers; 121, Foliage, flowers, and fruit of American Cotton; 122, Flowers and fruit of Bougainvillea and humming-birds; 126, Flowers, foliage, and fruit of a Passion-flower; 128, Flowers, foliage, and fruit of *Eugenia*, and sulphur butterflies; 131, Dr. Lindl's garden, Lagoa Santa, Brazil; 132, Flowers and foliage of *Malva*; 133, Foliage, flower, and fruit of *Natrecium*; 138, *Passiflora* and humming-birds; 150, *Natrecium* and *Passiflora*; 151, Foliage and fruit of the Akee; 153, *Bilbergia zebrina*; 154, Tree frogs among dead leaves—brown frogs and brown leaves of same colour; 156, Orchid—*Epistephium*, and large snail, gigantic land mollusc; 158, Bermuda Mount, Jamaica, with a Calabash tree covered with epiphytes; 162, Valley of Bamboos, Jamaica; 167, Foliage, flowers, and fruit of Coffee; 168, the Calaveras grove of Wellington; 169, Foliage and fruit of the Loquat; 182, Foliage, flowers, and fruit of *Lignum-vite*; 183, *Euphorbia splendens* and *Thunbergia alata*; 186, Study of Screw Pine: view of the Fern walk, Jamaica; 198, Castor and Pollux in Calaveras grove; 203, the Mariposa grove of big trees.

We have now enumerated less than one-third of the subjects we had specially marked for notice. Subjects of a similar nature with the foregoing occur in equal numbers to the end of the series, but space (at least, in our present number) forbids us going further. Every picture in the room is well worthy of notice, for every subject has been painted with some special motive kept carefully in view. Some of the *Nepenthes* are remarkable, and specially so that in 377; the inside of the pitcher is a whitish metallic green, marked towards the top (inside) with two darker green "eyes," similar with the "eyes" one sees on some larvae and on the wings of certain butterflies and moths; this plant has not been named by Mr. Hensley, and it seems well worthy, from its manifest distinctness, of special note. Other unnamed *Nepenthes* occur on 391: there appears to be one (if not two) very distinct species in this picture. In 586 some blooms of remarkable black and yellow colour are shown in the flowers of the Flame tree—*Nyctusia floribunda*. 556 is a notable picture of Sandal-wood with Mistletoe, the foliage of host and parasite so much alike as to be hardly distinguishable. 607 shows a *Teleopa* with an inflorescence equally fine with the plant recently illustrated in this journal. Gardeners will notice 515, Gardener's cottage in the Buitenzorg Botanic Garden, Java—an "airy hall" not suitable to Britain.

In the middle of the room, and mounted on a metallic table, is a large map of the world, illustrative of the distribution of vegetation. This is a most elaborate and highly-finished water-colour drawing, by Mr. Trelawney Saunders, without meridian lettering, by means of faint but distinct colours it shows the forests and cultivated grounds, the bush or scrub, prairies, steppes, deserts, swammy plains, glaciers, peck-ice, fields of seaweed, &c., of the earth. Miss North's original idea was to have a similar but larger map painted upon the ceiling, and it is to be hoped that this excellent idea will some day be carried out. Round the architraves of the doors, and in the panels, are numerous other plants painted on black or gold grounds by Miss North, these represent Tea, Coffee, Grapes, Hops, &c.

The building, of which we repeat our former illustration, although a large one, measuring 50 feet by 25 feet, designed by Mr. James Ferguson, F.R.S., is really much too small for the pictures to be properly seen—in a room two or even three times the size of the present one is required. We were not quite pleased with the big and heavy classic ornament upon the cornice, and we think the shiny black frames are too strong in colour. When a new issue of the catalogue is published, it will be well to alter 180, where it is stated that the trees of Ceylon are shown embedded in "stalactites;" we think, from the appearance of the picture, that this

word should be "stalagmite." In 207 is an excellent view of Niagara Falls from Pearl Island, with mist and double rainbows; the prismatic tints on these rainbows are repeated. We have not made a speciality of rainbows, but we think the prismatic tints in twin rainbows are reversed in order, and never repeated in the same sequence. If so, a touch of Miss North's admirable and prolific brush will set this right in a moment.

In the preface to the catalogue Sir Joseph Hooker tells us that the collection of pictures, the gallery itself, and even the catalogue, is a "free gift to the Royal gardens on the part of the accomplished lady, artist and traveller whose name the gallery bears;" and he justly says "that it is not possible to overrate its interest and instructiveness in connection with the contents of the gardens, plant-houses, and museums at Kew." Attached to the gallery is a studio, with conveniences for drawing and painting, and the house-keeper has a duplicate key, so that artists who may wish to paint at Kew can have plants removed to this studio and there paint them in quiet. Every person interested in horticulture, botany, and art will join with Sir Joseph Hooker in feeling "grateful" to Miss North "for her fortune as a traveller, her talent and industry as an artist, and her liberality and public spirit."

New Garden Plants.

ANGULOA DUBIA, *n. sp.*, s. *hjb.* (?)

This is a very curious plant. At first sight the flower reminds one of a lemon-coloured *Angoula uniflora*, covered on the inside of the sepals and petals with numerous minute purple spots. The shape of the flower is like that peculiar one of the species mentioned. The lip is very distinct. It is much compressed, with angular lateral lobes, and a very small triangular reflexed anterior lobe, with very few short hairs. There is no vestige of that intrusion on the inferior base that is so conspicuous in *Angoula uniflora*. It is white, with purple blotches inside at the base of each side. The lacinae and bidentate callus is ascending and naked, much like a sack. The rostellum of the column is very short. It is not proboosoid, as in *Angoula uniflora*, and there is no running descending line on each side of it, as in *Angoula Clowesii* and *Kuekeri*. Its odour is very powerful.

This plant may be a natural hybrid between *Angoula uniflora* and *A. Clowesii*. It is highly desirable that it should be well watched in future, to ascertain if it is constant, or whether it changes its features. It would, however, appear to be highly improbable that several deviations had taken place at one time. It was imported with other Orchids from the United States of Colombia, and is said to be like *Angoula Clowesii* in growth. Mr. B. S. Williams is the possessor of this great curiosity. If the *Angoula media* of Mr. Bowring were placed by its side it would make a fine assemblage. *H. G. Rehb. f.*

ONCHIDIUM UNICORNE (*Lindl.*) var. LETUM.

Mr. B. S. Williams found amidst numerous plants of the genuine variety a plant with an unusually broad pandurite lip, white, blotched with numerous purple-mauve spots; a horn of the same colour, having some teeth on the lower side. The callus is fine orange. It is charming for an orchidist. *H. G. Rehb. f.*

DENDROBIUM HUGHII, *n. sp.*

Before I had a plant, Mr. Hugh Low kindly sent me a herbarium specimen. I thought from the flower the plant might stand close to *Dendrobium revolutum*; the stems, however, are much thinner, and the grassy, linear-canaliculate leaves separate it widely. The flower has a fine Vanoid substance, just as in the above-named species. The thin chin is very much developed; one may call it conico-cylindrical by combination

* *Angoula dubia*.—Perigonii sepalis tepalisque exacte Angoulae uniflorae; lacinae compressa lacinae lateralis subultra; lacinae medianae triangulari reflexa minus subultra; carina laminaeformi ascendente apice bidentata; cum sinu obtuso; columna rostellato deflexo brevissimo; lacinae dubiae decurrentibus juxta rostellum subultra.—*H. G. Rehb. f.*
+ *Dendrobium (Dendrobium) Hughii*, *n. sp.*—Callus viridius tenuibus; Eius linear-canaliculatus; Dorsum setarum (nunc geminis tenuibus) illis Dendrobii revoluti aequalibus ejusdemque tibus; mento parvulo extusioriorum ovarium pedicellatum non aquante; sepalis ligulatis acutis; tepalibus oblongo rhombicis obtusangulis; lacinae basi cuneata subhembeo, dimidio inferiori angustiori medio contracto et angulato, dimidio antice subultraformi obtuso acuto; lamellis marginis exterioribus medio obtusangulis in paginam incumbentibus extrorsis; columna superne amplata, apice utriusque pone anteriam angulata—Singapore. Hugh Low nepos. *H. G. Rehb. f.*

of two opposite qualities. It reaches half the length of the stalked ovary. Sepals ligulate, acute. Tepals nearly rhomboid, obtusangular. The lip may be described as rhomboid, but suddenly constricted in the middle, and the superior part narrower, emarginate in the middle. These are two curious; free outside, reclinated each side on mid-line of the lip from the base nearly to the top. The column is much wider at the top near the stigmatic hollow, and has on each side the anther a triangular horn. The flower is of the finest and purest white. There is a light sulphur wart on the disc of the lip, an orange blotch under each horn at the summit of the column, and a mauve spot behind.

This new species was discovered near Singapore by Mr. Hugh Low, the son of Mr. Stuart Low, who was

ings. It may prove a novel plant, inasmuch as it produces as many as ten open flowers at once, which must make a very curious effect. It was discovered thirty years ago by Herrmann Wagener; it never came alive to Europe, as far as I know of, till now, when it is at last in Mr. F. Sander's hands. *H. G. Rehb. f.*

THE EXETER NURSERY.

THAT one of the finest nursery establishments in England should have taken root, and developed into a business of more than average magnitude, within the fief of the ancient city of Exeter, will not surprise any one who is acquainted with the geology and general climate of South Devon. The nursery was

remarkable tree is this:—It was discovered among a batch of seedlings, raised by Mr. Lucombe about the year 1773, from acorns saved from a tree of the Wainscot species, and as the plant developed peculiar qualities distinct from any other it was christened the "Lucombe Oak." Thousands of plants were raised from this tree which have been distributed in the adjoining counties, and all of which are said to have succeeded remarkably well. The tree retains its leaves through the winter, and the wood is said to be harder and of better quality than any other variety.

The glass erections are extensive, indeed there is a little town of glass, which begins almost at the entrance gates and extends in all directions over a considerable area. The first house upon the right was a few weeks ago filled with Tea Roses in pots, of such

FIG. 117.—THE "MARIANNE NORTH" GALLERY IN THE ROYAL GARDENS, KEW. (SEE P. 763.)

lately collecting in the Malayan Archipelago. May this modest discovery be the beginning of a series of lucky catches, and may this friendly dedication be accepted with as much pleasure as it is made with satisfaction. *H. G. Rehb. f.*

MASDEVALLIA VROSTACHYA, n. sp.*

This is in the way of the grand *Masdevallia Schlimii*, but the flowers are more numerous, on longer stalks, smaller and more abruptly caudate. Their colour is a dark cinnamon, and there are small orange mark-

* *Masdevallia vrostachya*, n. sp. — Pedunculo trigono; racemo plurifloro synamtho; bracteis cupulatis brevissimis hyalinis; pedunculis ovarisque longissime exsertis; Bract. cupula brevissima, mento rotundato; sepalis triangulis liberis brevissimis latiusculis; cavis elongatis; tepalis ligulatis acutis unineervis; labello elongato laciniis lateralibus humilissimis semioblongis antice angulatis; laecnia antica ligulata obovata apiculata apice infra ancipiti trinevis. *H. G. Rehb. f.*

ounded as far back as the year 1720, since which time it has enjoyed the highest reputation as one of the foremost establishments of its kind. The business is still conducted with the same energy as heretofore by Dr. Woodman, under the familiar title of Lucombe, Pince & Co.—a title than which there is none more widely known or respected throughout the whole nursery trade. The late Mr. Pince (the present proprietor's uncle) was so well known as a horticulturist of eminence, that further introductory reference is rendered needless. The entrance to the headquarters of the nursery is off the Alphington road, which is not more than five minutes' walk from St. Thomas' Station. The first object of notice is the seed warehouse upon the left, and the Lucombe Oak (*Quercus cerris* Lucombeana), which is not only a handsome and interesting tree, but also an historical one, upon the right. Succinctly the history of this

kinds as *Niphetos*, *Devoniensis*, and *Maréchal Niel*; and a large span-roofed structure upon the opposite side of the walk contained a very fine collection of *Azaleas* in specimens and half specimens, and of smaller sizes for the convenience of those who choose to begin with plants in a younger state. There is, however, this much to be said in favour of this excellent and well grown collection, that all the plants, both young and old, are in the most perfect state of health, and in the case of hard-wooded plants, which are slow growers, it is no small advantage to many to be able to avoid the slow and tedious process of growing specimens from tiny little plants, which is a work of years.

From the *Azalea*-house a brilliant display was observed a short distance off, in a light airy structure, which turned out to be Messrs. Lucombe, Pince & Co.'s celebrated strain of *Cineraria*, called *Wonder of the West*. The collection was good throughout, many of

the varieties being of large size and substance, especially some of the "deep blue" varieties, which are free growers and are admirably adapted for grouping in conservatories, or indeed for any other decorative purpose. Some of the flowers measured 3 inches across. The entrance to the Palm-house was festooned with Clematis montana grandiflora, which seems amenable to any kind of treatment or training. The structure is embellished in the inside with creepers, loosely trained, of Ipomoea Learii, Passiflora racemosa, and Bigonia Pandora. The specimens comprise most of those kinds that are rare and useful among Palms, and the different varieties are carefully disposed to the best advantage. In this house Palms may be said not only to be grown, but also exhibited, so carefully and skillfully are the different forms of leaves brought into contact with each other, and so good is the effect. There are also flowering specimen plants and Tree Ferns arranged with the Palms.

The show-house, which is entered from the Palm-house, is a division of the same structure, and was gay with choice flowering plants of Bougainvillea glabra, Clerodendron Thomsoni, Tree Ferns, Callas, which formed a massive background; Cytisus, Hydrangeas, Azalea mollis, Lachenalias, and finely-flowered samples of Hymenocallis macrostephana. The Camellia-house is an immense structure, 200 feet long and 24 feet wide, having large bushes of the very best varieties in cultivation planted out in a bed in the centre, and the walls draped with free-growing kinds, which have a grand effect all through the winter and spring months. The old and now scarce variety reticulata is a fine plant, having healthy foliage in greater profusion than is usually met with in this variety. The flowering extends over a period of several months, and the effect produced by so many large specimens in flower of different colours may be more easily imagined than described. Some of the largest plants in existence anywhere of *Luculia grattissima* are trained as wall creepers at one end of the Camellia-house, and they, too, are remarkable examples of plant growing. From the Camellia-house a number of smaller houses are reached; one, an Azalea-house, filled with large white Azaleas for coming into flower at Christmas, then a house full of Pelargoniums, and a propagating house. The general collection of stove plants (for it is important to distinguish between the general collection and the "show" collection) will be found in a house over 200 feet long in three divisions, and consist of *Stephanotis floribunda*, *Bougainvillea glabra*, *Aspidistras*, *Ficus*, *Ardisia crenulata*, *Medinillas*, *Bougainvillea spectabilis*, a ready grown specimen for exhibition, stove bulbs in thousands, *Gardenias*, young Palms, *Phyllanthus atropurpureus*, *Hibiscus flavus plenus*, *Franciscana calycina major*, and representatives, of one size or other, of almost everything that is worth growing in a plant stove.

What is particularly gratifying to the practical cultivator is the opportunity he finds in this nursery of inspecting the different classes of plants by themselves. If he be an Orchid grower, there is the collection arranged to his hand, and not only arranged in separate divisions, but in their respective species. The Heath grower will find his favourites occupying a long airy structure by themselves, and the Croton or foliage man will find giants of his pets in quarters which are exactly suited to them. But to return to the Orchids, the plants recently in flower were *Dendrobium pulchellum*, *D. Paxtoni*, *Oncidium carthaginiense*, *O. spheacelatum*, *Odontoglossum Pescatorei*, *Stanhopeas* in baskets, *Epidendrum microchilum*, and the general collection consists of *Calanthes* (grand bulbs) *Veitchii* and *nivalis*, *Cypripediums*, *Dendrobiums* and *Oncidium*s. *Cattleyas*, *Lycastes*, *Saccolabiums*, *Aerides*, and *Phalaenopsis*, are also largely grown, some of the latter being very promising plants, grown in baskets or on blocks. In one of the Orchid divisions I noticed a dainty little group of *Bertolonia Van Houttei*, than which there is no more pretty or interesting class of plants to be grown in a case in the plant stove. These plants are certainly not fit for everyday use, but any one who grows plants for the love of them will find themselves rewarded by cultivating a few of them.

The Heath-house is 150 feet long, with a centre stage well raised, and side stages and path all round. The clean flag paths and excellent order maintained throughout the houses is nowhere more conspicuous than in this Heath-house, where the different specimens are neatly trained and arranged in order that every plant may enjoy the full benefit of air and light—conditions which it is unnecessary to state are indis-

pensable in the cultivation of Heaths. The flowering plants are about equally distributed over the entire house, and these consist of *Erica profusa*, *E. Cavendishiana*, *E. aristata major*, and *E. Devoniana*. As objects of cultivation the *Aphelexis* are a prominent feature, as also the violet-coloured *Diosma* and *Adenandra fragrans*, a plant bearing *Vinea-like* flowers which tend to enliven and brighten up a collection of hard-wooded plants. *Darwinias*, *Acanthias*, *Lapagerias*, *Kennedia rubicunda*, *Chorozemas*, *Tremandra verticillata*, and *Phenocoma prolifera Barnesii* are all grown in considerable numbers, and in sizes suitable for any purpose either for forming a collection for private use or exhibition, or both combined. No one having any knowledge at all of plants can pass through this collection without being impressed with the fact that the loss to private gardens of such substantial plants to make room for a few gaudy subjects is an error which sooner or later the horticultural public will be sure to recognise. It is a poor garden indeed where one house of some size or other cannot be spared to accommodate a small collection with the meagre shelter that they require for six months or so in the year. But I must revert to my text, and proceed to notice the stock of show and decorative Pelargoniums (trained), without exception the most exemplary collection that I have come across anywhere. There are about 1000 plants in this house, and here again the utility of having abundant glass accommodation is strikingly exemplified in the dwarf, I had almost said elegant, symmetry of the plants. The structure was specially built for Pelargoniums, and each row of plants is not more than a foot from the glass, hence the reason of their dwarf sturdy growth.

Next to the Pelargonium-house are several Rose-houses, about 130 feet long each, and in which the Roses are either planted out or grown in pots for supplying cut flowers in winter. One house is filled entirely with *Niphetos* and *Général Jacqueminot*, the second is stocked with *Gloire de Dijon*, *Niphetos*, *Maréchal Niel* and *Devoniensis*, planted out and trained to wires; and the same structure was crammed from end to end with *Callas* in flower, so that two good paying crops are taken from the same house at one and the same time. *Niphetos* is *par excellence* the Rose of the day for producing winter flowers that bring nearly any price that is asked for them. The next house to be noticed is the "old stove" a familiar title, and one indicating that a more modern structure has supplanted it in the place of honour which it once held. And yet these old houses are very often notable places, or rather they give shelter to notable plants. It would perhaps be a convenience to many plant growers to have an "old house" for some of their best things, because people, as a rule, do not expect to find good things in such places. At all events, the "old stove" to which I am referring is not less interesting when you get inside than some of those fashionable-looking buildings which are known by another appellation. If fine Orchids and a collection of Ferns and other miscellaneous plants are anything to look at it goes some way towards proving that good plants may be grown in houses void of external embellishment. The fernery is remarkable for its stock of choice Ferns, many of them fine trained specimens. Reference is particularly made to the stock of *Gleichenias*, in all the well-known varieties of the species, of which there is a very superior collection in the rudest of health. In the same house there is a plant of *Pritchardia pacifica*, said to be the finest in the country; and some extra fine plants of *Phœnicophorum sechellarum*. *Davallias*, *Gymnogrammas*, and *Nephrolepis* of sorts are also noticeable either in point of training or cultivation, many of them for both.

(To be continued.)

FLOWERS IN SEASON.

A FLOERIFEROUS WEIGELA.—How curious it is that a floriferous shrub does not appear to attract anything like the same amount of attention that a fertile Vine or Peach tree, or even a prolific black Currant does. The reason is obvious in one respect. We have made it a point to eulogise and proclaim anything remarkable in fruit growing, because the bulk of employers and the population of the country generally are more interested in obtaining a good supply of fruits than of flowers, the latter of which can be more readily dispensed with than the former. But it probably does not occur to every one that what makes the fruit tree prolific also makes the shrub free-flowering. Good drainage, a favourable situation, and well matured wood, are conditions which

are absolutely necessary in producing fertility in fruit trees, and the same conditions will cause flowering shrubs to bear three times as many flowers as they usually do. The plant to which especial reference is now made is an aged one, and stands upon the brink of a slope, where, no doubt, the ample natural drainage of the situation, and the fact of its being well exposed to air and sunshine, causes the wood to be more than ordinarily well ripened. The soil, too, must be exhausted, as is evidenced by the smallness of the wood, which also assists in producing that perfection of maturity which plants growing under the shade of other trees, and in richer soils, never attain. A single shoot 2 feet in length upon this shrub has fourteen sprays of flowers upon it, forming as perfect a natural wreath as ever was made by the hands of a florist. The flowers are borne in a double row the whole length of the shoot, every set of two sprays being the same distance apart.

COTONEASTER EUNIFOLIA.—This is a useful plant for covering walls or creeping over rockwork, and is now bright with its tiny white blossoms, myriad in number. It is pretty alone, pretty anywhere, but the effect is improved by dotting a few (not many) hardy Ferns amongst it. The green points of the young fronds have an especial charm, peeping out from among the little white blossoms, and the ugliest of walls covered in this way will be pretty at any season of the year. Of Ferns small plants of *Polypodium vulgare* or *Scopolopendrium* will answer the purpose.

DOUBLE WALLFLOWERS.—Although several severe winters have proved sadly destructive to these old garden favourites enough has been saved to keep stocks in existence, and as the past winter have been of a generous mood many plants in fine bloom have here and there been seen. Like all double flowers that of the Wallflower has to bear comparison with its single congeners, and in this particular case the comparison is not favourable to the double kinds. Single forms are all so beautiful, so sweet and so easily raised from seed, that they will never be elbowed out of popular favour by any double forms. But these latter are not without their charms; they, too, are sweet, and do not indifferently compare with double Stocks, Rockets, Cloves, and similar flowers. They are perennial, and once planted remain to bloom for several years if in sheltered positions. They furnish always acceptable cut flowers, and, not least, may be freely propagated by every gardener by means of cuttings. It is chiefly to the lack of this latter act that we owe the present scarcity of the double kinds. Cuttings should be put in now, using the robust spring growth for the purpose, or in the autumn, when cuttings made from the season's harder wood will stand through the winter and root freely early in the spring. The coarse growing German double forms raised freely enough from seed do not come into the ranks of true perennial doubles, and this latter tribe does not constitute a large section. The old deep red or black kind seems to be missing in many localities, still it may exist somewhere. The dark mottled red is abundant, and so also is a very striking reddish-buff form that is most free. The old double yellow, the pretty dwarf kind, known as Harpur-Crewe's Double, and the Whin-flowered buff yellow, are all distinctive, and of the best to be found in cultivation.

CAMPANULA MACROSTYLA.—This is a singular and distinct annual Campanula, that is much admired wherever it is seen, but it is unquestionably somewhat difficult to grow. The flowers are large, of a pale ground colour maculated with lilac-purple, and the sharpened points of the flowers are distinctly tipped with purple. A curious horn-like style stands out from the centre of the flowers. One who has been successful in raising and blooming this Campanula recommends that the seed should be sown in January, and the plants be grown on freely and not allowed to sustain a check from the cold till hardened off and planted out in June. Mr. Barron flowers it nicely on the rockwork at Chiswick.

BERBERIS FORTUNEI.—This is a very striking plant at this season of the year for a shrubby bed or border, and has a fine effect planted in conjunction with *Deutzias* or light-coloured *Rhododendrons*. It bears large clusters of berries, which, as they approach maturity, are covered with a dense bloom, which are even more attractive than its rich

beautifully cut leaves. At Haldon House, the charming seat of Lord Haldon, near Exeter, it is planted as a background to a group of herbaceous plants, in which position it is highly effective, and if not so bright as some of the herbaceous plants it is certainly not a less interesting object.

RHODODENDRON GRANDE.

This noble species, illustrated in our supplementary sheet, was discovered originally by Griffith in Bhotan, re-discovered by Sir J. Hooker, in a different form, in Sikkim (*R. argenteum*), and a further form was, later on, discovered by Booth in Bhotan (*R. longifolium*). The writer of this note has reason to believe that many forms of the species are to be found in the eastern Himalayas.

Wight tells us that Griffith "briefly characterises this species in the single word 'magnifique,' which idea I have attempted to convey in the specific name." That the name is no misnomer, will probably be admitted by all who saw the flowers and the grand foliage lately at the Royal Horticultural or the Linnean Society. The five-and-twenty to thirty large ivory-white florets, with deep purple spots at the base, and the brilliant red stigmas, slightly, and when fresh only slightly, nodding on their stalks, formed a fitting centre to the splendid, leaves, deep green above, and snowy white below. But those who have grown the plant can add to the above the glories of the rising leaf-shoot, the rich and varying bronze and green tints, the crimson scales, and the profusion of silvery down; nor must it be omitted that the flowers are deliciously scented, and last very much longer than most Rhododendrons.

The plant from which the flowers were taken was about 8 feet high and had sixteen trusses of bloom; it was grown in a cold greenhouse, for the species is not quite hardy. This journal remarked that the blossoms far surpassed those portrayed in Sir J. Hooker's plate of *R. argenteum* (the plate in the *Botanical Magazine* is wholly inadequate), but it will be interesting to quote Sir Joseph's words, as follows:—"The great *R. argenteum* grows as a tree 40 feet high, with magnificent leaves 12 to 15 inches long, deep green, wrinkled above, and silvery below, while the flowers are as large as those of *R. Dalhousie* and grow more in a cluster. I know nothing of the kind that exceeds in beauty the flowering branch of *R. argenteum*, with its wide-spreading foliage and glorious mass of flowers." (*Him. Journ.*, i., p. 126.)

The parts of the flower are usually in eights, but this is not uniform in the species, about which, it must be confessed, some confusion exists. The writer of this note is engaged in enquiries and observations at home and in India, which he hopes will throw light on the subject. *J. H. Mangles, Valewood, Haslemere.*

CONSERVATORIES AND HOT-HOUSES.

I HAVE just had a talk with a builder of conservatories and hothouses. Knowing him to be a perfect master of his trade and to take a pride in the work he turns out, and having confidence in his judgment, I ventured, with the view of drawing him out, upon the observation that many of the glasshouses one encounters now-a-days are made of bad materials, are ill put together, and present a flimsy and tawdry appearance. "You are quite right," he frankly answered; "and the fact is pain and grief to every horticultural engineer who cares a fig for his profession." "But what," I asked, "is the reason of all this 'jerry' building in a department where one would least expect to find it—is it only natural to think that a man who has taste and spirit enough to go in for a conservatory, will have common sense enough to go in for a good one?" "The ruin of good work in our business, as in that of the building trade generally," replied my friend, "is the contract system. Under that system the demand is nearly always for cheapness, and the thought of quality and style scarcely ever suggests itself. The lowest tender is almost invariably accepted, although in ninety-nine cases out of a hundred a good sound tradesman will tell you, and tell you truthfully, that it is impossible—absolutely impossible—for the materials to be provided and the work done for the stipulated sum." "The contracts are, nevertheless, carried out," I suggested. "They are carried out in a fashion," was

the answer. "Let an architect or surveyor who is at once vigilant and above suspicion be employed, and the contractor will be tired of his job long before he has finished it. Every day that the architect insists upon a proper execution of the specification, the builder will lose money, and he will only be too glad to move off to fresh woods and pastures new." It seemed to me that it was not easy to depart very widely from a written specification, at all events in horticultural buildings. I was assured, however, that in the absence of really competent oversight, nothing could be easier. "You may be cheated," said my informant, "both in the material and in the way it is put together. There is a great difference, for instance—though the man who orders a conservatory to be built is generally ignorant of the fact—between using sound red deal, which contains a proper proportion of turpentine, and using the inferior kinds of deal known as white woods, which contain no turpentine, or next to none. These latter woods in a very short time become rotten by exposure to the atmosphere. Door furniture, again, can be got from Birmingham at fourpence-halfpenny a set! It will make a brave show for a few days, and after that the opening or shutting of a door will be a vexation of the spirit and a weakness of the flesh. Why, indeed, with the shrinking of wood, and the failure of latches and door knobs, the whole edifice shakes as if it was built on a bog, and there is literally no pleasure in it. If you open a door or a window, you are in grave doubt whether you can ever shut them again, and if you shut them you sigh to think of the manoeuvring that may be wanted to open them.

Then there is the question of glass. The compilers of unremunerative tenders—unremunerative, that is, if they are not deceptive—generally use foreign glass, which is a trifle cheaper than English if bought in certain sizes already cut. It has the defect, from the manganese used in its manufacture, of turning purple after being exposed to the rays of the sun for a while, whereas English glass always remains clear and colourless. As to the work, it can be scamped from the egg to the Apples. You can give the go-by to honest joinery altogether. Examine a cheap house. I defy you to find a mortice and tenon. All the joints are sham joints, nailed with iron nails! I need not tell you that such work as this entails considerable expenses in repairs, nor that bad work can never be turned into good work, whatever is done with it. On the subject of glazing I will give you a hint that may be useful to you. None of the patent joints are air-tight, and no composition has yet been discovered that has the stability and durability of putty. My advice upon this point is—stand upon the old ways. The only system of glazing without putty is the old English system of lead glazing, which is not applicable to horticultural buildings, though it is coming up again in other buildings, as a matter of decoration, in connection with the Queen Anne revival. Again, in regard to painting, the best white lead should be used in a good job, but in a cheap job the probability is, that whitening will be substituted for the white lead or mixed with it, the consequence being that after an exposure of two or three months to the weather you can rub off with your fingers in the form of powder." "Then the sum and substance of your advice to a man about to build a conservatory," I said, "would be—'Don't build it by contract?'" "Decidedly," replied my friend; "I don't say come to me or send all your friends to me, but go at all events to some tradesman in whose skill and honesty you have faith, tell him what you want, show him that you are not so unwise as to expect a good article at a low price, and you may depend upon it that in the end you will fare better than your neighbour who takes the lowest of five-and-twenty tenders." *T. T.*

MECONOPSIS NEPALENSIS.

OF all the plants in my garden this spring I do not know that any has afforded me more interest than this. First, I have had the pleasure of anticipation, and this process, I must say, was rather prolonged, for it was in the rainy season of 1879 that I procured the plant—then a tiny babe—through the kindness of a friend. Since that time I have watched its golden-haired rosette of leaves as they increased in size; each year I have looked forward to see its elegant spire of flowers, but each year I was disappointed. I found compensation, however, in observing the singular manner in which the leaves raised themselves erect around the central bud or spread themselves flat on the ground, and I said to myself, if I were not tied to the desk in the big city order, I would endeavour to find out what this movement meant and how it was done; but other things more urgently needed attention than the rise and fall of Poppy leaves, Last

autumn my waiting was rewarded: that uplifting and downfalling may have been one phase of the extra life-power called into play to form the flower. Be this as it may there were the tiny flower-buds nesting in the centre of the leaves, and early this spring it was evident that a start was to be made. Sure enough gradually arose a stately shaft clothed with tawny hairs, and spreading abroad its oblong boldly cut leaves. In the axils of the uppermost of these two or three hairy globes were visible, the central always the larger. Presently, as growth went on, the globe lengthened into an oblong shape, the two sepals were pushed off from below by the gentle insistence of the pale primrose petals within, and the broad, bell-shaped, pendulous flower was unveiled in all its elegance. One after the other they opened from the top of the stalk downwards till the whole stalk reminded one of a peal of bells hung one above another. Within the delicate petals were the numerous orange anthers, and in the centre a bristly pistil, with a stout column for a style, tipped with a lilac stigma, the colour of which formed an exquisite contrast with the yellow of the petals. Being somewhat of a Paul Pry in the matter of flowers, I must needs make use of a powerful pocket-lens to look at the tawny hairs, and the result is, that I strongly advise every one else to do the same. On the leaf there is a dense undergrowth of tiny stars, from among which, like so many saplings, spring long bristly hairs, very finely toothed. How pretty are the crystal globes of water which form on this hairy surface after a shower; how perfect the protection against a wetting. On the flower-stalk the hairs are more closely packed, and so branched and notched at the edges as to form a jagged, comb-like fringe. The sepals are covered with similar hairs, while the pistil and young fruit is covered with a perfect *cheval-de-frise*, intended, I presume, to keep off intruders and hungry insects from parts of the flower where their presence, with ill-regulated appetites, heedless of the necessity for forming and scattering seed, is not desirable. On the other hand, the large lemon-yellow petals are doubtless so many invitations to insects to walk in and partake of the food prepared for them. At the same time the principle of reciprocity comes into play, and the insects, having feasted for their own convenience, are made to forward the interests of the plant by acting as go-betweens in the process of setting its seed. I observe that the anthers of any particular flower are as a rule open, and that the pollen is ripe before the stigma of that same flower is ready for setting, hence it is clear that the pollen must by some agency be conveyed to another flower where the stigma is in proper order. I watch the whole process day by day as the successive flowers open. The insects come in abundance—flies, bees, butterflies, they all come; and the result is, that I believe every flower on my plant is set. Obliging insects! how ungrateful we mortals are. And now I notice another thing, the flower bells were all pendulous, as bells are wont to be; now as the bristly capsule commences to ripen, the pendulous position is exchanged for the erect, and my plant is a mass of uplifted capsules, the stalks resembling the branches of a candelabrum, the capsules recalling the lamps, and the whole of such a form that its outline is an almost exact reproduction of that of the leaf. The leaf, as spread flat on the page as I write, is long and narrow. It is at its broadest about midway between the centre and the tip, and at its narrowest at the base—in fact the form is that of a much elongated egg, high shouldered at the broad end, tapering very gradually to a point at the narrow end. I sketch this outline as nearly as I can and hold it side by side with the plant in its present state, and I find that but for my clumsy manipulation the outline of the leaf and that of the plant would correspond almost exactly. But Paul Fry-like again, I want to know what force has turned those hooked flower-stalks into stiff erect ones, thus overcoming that tendency to fall which the ever-increasing weight of the ripening capsule must surely induce. Can it be that growth is quicker and more potent in one direction than another. If so, it might be expected that the less rapidly growing part would drag on those growing more rapidly and cause the whole to straighten. Further, if we suppose that active growth is especially exerted in a spiral direction around the stalk—that stalk being fixed at the lower end—a straightening process would evidently ensue, and the erect posture would thus be the result of a compromise between the forces of growth exerted in succession,

now on this side now on that. Besides, in all probability, if Mr. Francis Darwin were to affix his tell-tale filament to the stalk, he would be able to show us how the whole stalk gyrated in correspondence with all these inner movements. But whether all this be true or not, certainly no more elegant, no more *distinct* plant than this *Mecopis* has met my eyes this spring. The elegance is, to my fancy, not merely that of shapely features, but enhanced—by intelligence, I was going to say—at any rate, by the varied expressions of active life which add so vastly to the interest with which one looks at flowers when that expression is not obliterated by the procedures of the florist. *Jack Towel.*

BROOMFIELD, CHELMSFORD.

MR. ROBERT WARNER'S collection of Orchids is well known to all growers of this class of plants, and Mr. Warner, one of our oldest cultivators, has also shown us how to grow Orchids to perfection. For many years past this collection has been celebrated for its grand lot of Cattleyas, especially of the C. Mossie section, of which there were usually some hundreds of blooms out at one time. This was the case for a number of years, and we may say the same of the *Phalenopsis*. At one time the roof of the East India-house was one mass of bloom, and contained such kinds as P. Schilleriana, P. amabilis, P. grandiflora, and the rare P. Portei. There were many fine varieties, and the plants were so well grown that they produced blossoms of a size and richness of colour that one seldom sees now. The plants were grown in a large house, suspended from the roof; their foliage was broad and of great substance, they had plenty of ventilation, which makes them vigorous, and they are able to stand being taken about, and the flowers remain in perfection a long time without their leaves shrivelling.

We may here mention that air must only be admitted in the house on warm days. Mr. Warner is always most particular as to cold draughts, and the plants were never allowed to be soaking with water, as one often sees them. In their native country they may have heavy rains and dew at night, and, as Mr. Warner states, when looking at his plants he likes to follow Nature as closely as possible. In their native country they are found growing on branches and stems of trees, where, of course, they get the full benefit of the air and light, and yet are shaded from the burning sun. In our glasshouses they require a good supply of moisture, but the atmosphere must not be overcharged with it; let the house dry itself during the day, which is an imitation of day-time in their native habitats, where their foliage then gets dry, and at night the heavy moisture supplies their requirements.

The Vandas are another great feature in this establishment, and are kept up with spirit; they are grown in a house where they obtain plenty of light, and we have never seen Vandas grow or flower more freely. On our visit these were finely in bloom, and they are to be numbered amongst Mr. Warner's successes. The reason why he blooms them so freely is that he gives them very thin shading, which plan is followed up in all his Orchid-houses. There were some fine plants of *Vanda suavis*, with many spikes of blossom, and also the rare and fine form of *Vanda tricolor* Warneri, the best of the tricolor section, some of the specimens producing four spikes on each; also *V. tricolor insignis*, and in the same house was a fine form of *Trichopilia suavis*, with beautifully spotted flowers; also the showy *T. crispata*; and by the side of this was the *T. lepidota*, a charming species. *Cypripedium caudatum*, with its curious long tail; C. Warneri, one of the brightest and most free of all the barbatum section, and one that every grower should procure. This was one of the finest plants exhibited at the St. Petersburg international show, where Mr. Warner's collection was the finest display of Orchids.

Now we come to the principal attraction at Broomfield—namely, the cool Orchids, which are no doubt more numerous than at any place we have seen. Our readers will be surprised when we tell them that there are 12,000 plants of *Odontoglossum crispum* and its varieties at this place, and the greater part of them fine plants; besides these there are many other cool Orchids which are well looked after by Mr. Warner's gardener (Mr. Jarrett). This collection has been forming for many years, and of

course in it are to be found many of the finest varieties, as Mr. Warner has spared no pains in collecting the best forms and varieties. He is one of the most able judges of these plants, and he has had a collector out, so that he can select and send home the best varieties that can be found, and that is the reason he has such a large quantity. Of course, amongst such a numerous collection some bad forms must creep in, and which may be found in almost all importations; but when a collector is employed the best can be selected, and there is more chance of having a better result, as the natives when left to themselves, and paid so much per hundred for collecting, do not mind whether they are good or bad so long as they are *Odontoglossum*. The first house of *Odontoglossum* we entered is 60 feet in length and 17 in width, with a centre table and tables on each side. This was a sight that no one could conceive unless they saw it; it was beyond my comprehension, as I had no idea of seeing such a glorious sight. There were many hundreds of spikes in full beauty, the glorious spikes of bloom arching over the foliage; and intermixed with *Masdevallias*, of which there is a well grown collection in full beauty, the effect was striking and complete. We now descend a few steps, and when the canvas door is open our eyes have the full feast of this glorious display; indeed, it may be described as a complete forest of flowers of almost every shade of colour, from pure white, crimson, magenta, orange, scarlet, &c. I mentioned a *canva door*—this is placed there in warm weather to allow the fresh air to pass in. I was surprised to find such a quantity of air admitted into this house. You could even see the flowers moving as though they enjoyed the breeze. Some fresh air is always kept on both night and day, and no doubt this is the cause of so much success, and of their producing such fine spikes of flower. The plants are grown strongly, and the bulbs well ripened, which is a far better plan than bringing them up so tenderly as some amateurs do.

I will name a few of the most conspicuous in this house. The varieties of *crispum*, many of them, such as *crispum Warneri*, with its white, rose, and crimson-spotted flowers, form a good contrast with the white varieties, of which there were many of a large size too numerous to mention; there were also several specimens of *O. hebraicum*, a very distinct form of *O. Andersoni*: there were several plants with its charming spotted flowers; *O. Edithæ*, which is an elegant variety, and I believe only to be found in this collection. *O. Coradinei* was there, with its white and brown flowers. *O. prionotepalum*, also very distinct, with its white and spotted flowers. *O. radiatum* was unusually good. *O. O. Hallii* many varieties of this showy species, with fine spikes overhanging the *crispums*; also triumphans, with its bright yellow and bronze-like flowers. *O. roseum* was very bright in colour, and produces a good contrast with other colours. The *Masdevallias* were charming. Amongst them were many varieties of *M. Harrayana*, also grand forms of *M. Veitchii*, with very bright colours; also *M. Lindenii*, *M. Harrayana reflexa*, which is a curious growing form. The finest in the collection is a new one, called *Imperialis*, with the brightest colours and the largest flowers we have seen. It was exhibited by Mr. Warner recently at South Kensington, and received a First-class Certificate, and it was the admiration of every one who saw it. This was from an importation. We noticed intermixed with the *Odontoglossum* the orange-coloured *Epidendrum vitellinum majus*, which is grown in large quantities here, and is well adapted to intermix with the *Odontoglossum* to help throw up the white and pale-coloured flowers. We were loth to leave this house, but there are more of this class of Orchids to speak of yet.

The next house is a span-roofed one, with a path up the centre: it is about 40 feet in length. This is filled with *Odontoglossum*, but they are not in bloom; many hundreds are, however, showing flower, and they seem in the best of health. By the side of this was another span-roofed house, where were many fine plants of *Masdevallia* in bloom, and other showy flowers, also several hundreds of *Odontoglossum* of smaller size. We went further on, and here we came to a span-roofed house about 70 feet in length filled with *Odontoglossum crispum* and its varieties. The whole length of the house was one blaze of bloom, overhanging each side table. Besides those on the tables there were rows of plants hanging from the roof, showing spikes of buds which will be coming into bloom in order to keep up this grand show for many weeks. *T. Foster.*

The Herbaceous Border.

PRIMULA SIKKIMENSIS.—After buying this plant in pots two or three times, and planting it out, and losing it after flowering, I obtained a good stock from seed last year. Like most other *Primroses*, if grown fast and planted out when large enough, and never confined in a pot, its cultivation appears to be easy enough, though the plants will probably not last longer than other *Primroses*—two or three years. Having tried it in all kinds of positions, in none of which the strong seedlings refused to flower when two years old, I think it does best at the base of a rockery with a westerly aspect, where there is a foot of well drained made soil and a cool subsoil. The plants, of which the flower-stalk ranges from 2 feet to 15 inches in height, grow stronger in this situation than in a bog bed, where they have always wet a foot below them. *C. Wolley Dod, Edge Hall, Malpas, June 5.*

GENTIANAS FROM SEED.—The notes of Mr. Correvon on the cultivation of alpine plants have proved so useful to me that it may appear ungracious to question any of his statements, but when he says (p. 736) that seeds of *Gentianas* take a year and a-half or two years to come up, he probably means that it is so when the seeds are sown in the open ground and left to the chances of the weather. During the last two years I have raised three kinds of *Gentian* from home-saved seed and seed which had been kept dry through the winter, and in each case the seedlings were visible in two or three months after sowing. The kinds were *G. acaulis*, *G. cruciata*, and *G. septemloba*. I cannot raise alpine plants from seed in the open soil, but I sow in pans in February or March, covering them with a frame-light, and never allowing the soil to get dry. I give no artificial heat at all, but give them all the benefit of sun-warmth. Some kinds, especially *Primroses*, I find it better to sow as soon as the seed is ripe. No doubt many kinds of seed germinate better and quicker in this way. I find that some plants, which have the reputation of growing very slowly from seed, do not require so much patience as is generally supposed. For instance, I sowed seed of *Dodecatheon integrifolium* as soon as ripe in June last year. The seed came up at once, and the seedlings were planted out in a store bed in autumn, and in May this year, when the plants were hardly ten months old, about one-third of them flowered. *C. Wolley Dod, Malpas, June 5.*

ANCHUSA ITALICA.—We frequently see notices of the lovely Forget-me-not, *Lithospermum prostratum*, and *Omphalodes verna*, the beauties of which are extolled on account of the choice blue of their flowers; but we seldom or never have any mention made of *Anchusa italica*, which, if it does not surpass the above-named deservedly popular flowers, is equal to either in richness of colour, and affords fine sprigs for cutting to furnish vases, or for working up in bouquets. Being a perennial of strong habit, it can quite hold its own among weeds and grass, and is specially adapted for planting near the sides of woodland walks or in semi-wild places, where, from the free way it spreads and seeds, it soon becomes naturalised, and forms bold, irregular patches or masses that are sure to arrest attention when the plants are clothed, as they are during early spring and summer, with a wealth of gay blossoms. These are borne profusely on tall branching bisulcate stems, and are about the size of those of the *Lithospermum prostratum*, or *Myosotis dissitiflora*, and of a shade between the two; and as the *Anchusa italica* will grow and flourish where they will not, its value may be estimated and judged of accordingly. With us, in our hardy fernery, it is quite at home in dense shade or out in the open, and appears perfectly indifferent in regard to soil, for whether in moist sand or clay it does equally well, and flowers with the greatest of freedom. Those who would like to cultivate this very desirable plant should obtain seeds and sow at once under handlights, by doing which plants may be raised and got up strong enough to bloom next spring, or crowns may be obtained later on, when the tops die down, and they are fit for removal. *J. Sheppard.*

HERBACEOUS AND OTHER PLANTS AT MR. WARNE'S.—A mild early spring, succeeding a winter which had little in it beyond the name, as might be expected has not been without its influence on most

of the best and rarest kinds of herbaceous plants, many of which are this season flowering unusually well. Where all that it is possible to procure in the shape of rarities, as well as everything worth growing of a more common character, are brought together and cultivated under conditions found best adapted for the wellbeing of each, in a season like this the many acres occupied by the enormous stock present such variety in form and colour, as may be sought for in vain in any other division of cultivated plants. Large masses of any particular species, such as here present, when seen together, give very different impressions of what the plant really is than is possible from the meagre isolated examples often met with. On the extensive rockwork, where stations have been prepared to suit the wants of particular species, in long borders sheltered from cutting winds, and in others where needful shade from the sun is present to meet the requirements of those things which do not like its full play on them, and in beds and quarters without number in this home of perennial flowering plants, may be seen such a display of bloom as is by no means forthcoming every season. To name individually the species and varieties of fine things that have been and are now in flower would make a formidable list, but we may mention a few of the most beautiful and interesting—*Meum athamanticum*, an Umbelliferous plant bearing pretty white flowers, and most elegant leaves; *Anthericum liliastrum*, St. Bruno's Lily, has lovely pure white flowers; *Borbartia aurantiaca*, an orange flower, distinct and handsome; *Zephyranthes atamasco*, flowers similar in form and general character to the better known *Z. rosea*, but quite white; *Calochortus scerulea*, white ground, with purple or dark blue spots, very pretty; *Cyclobothra pulchella*, a beautiful yellow-flowered Liliaceous plant, not very plentiful; *Brodia inxoides*, and one or two others, all desirable small bulbous plants; *Ixiolirion tatarica*, purple and very pretty. Amongst Aubrietias, where all are good, Hendersoni is still the best bright violet; *Cistus formosus*, bright shining yellow, with a dark spot on each petal; *C. florentinus*, flowers white, these two dwarf shrubs deserve a place in every garden. Hundreds of other species of herbaceous and alpine plants, either in bloom or fast approaching this state, are here, in addition to the more cultivated hardy garden plants, such as Finks, of which a collection is grown in quantity of the kinds that those who want to cut and come again require.

Amongst these are *fimbriata alba major*, the large form of the old white; Mrs. Simpson, a beautiful white variety, with a tolerably smooth edge; Derby Day, pink ground colour, laced with red; Ascot, light pink, with a dark base to the petals; Mrs. Moore, good white, laced with purple; Lord Lyons, dark purple; and Ware's Clove: these are all really good varieties. Amongst Delphiniums are *Gloire de St. Maude*, dark blue, shaded crimson; *Belladonna*, the old sky-blue variety, is not surpassed in its shade of colour; *C. Glyn*, bright blue, centre white; Mrs. F. Helm, dark blue, white eye; Cambridge, as its name would suggest, light blue, with dark centre; *Gallica plena*, double, bright blue; Heerman Stenger, violet, with a metallic tint; these are distinct, and where well done, too, will make a feature in any garden. Of *Orchis foliosa* there is a large bed containing more plants most likely than many to whom this fine hardy Orchid is known ever saw on one occasion before. The same may be said of the hardy *Cypripediums*; of *C. Calceolus* there is a grand lot. Many of the other hardy kinds are here, also thriving well. Ferns, of which there is a fine collection, are alone worth seeing; the deep and delicate colours in these gorgeous spring-blooming plants are not surpassed in any other family of hardy flowers. There is an unlimited quantity of double and single *Pyrethrums*, comprising all the most distinct kinds. These have the merit of being amongst the best plants that can be grown in the neighbourhood of towns, as they thrive where the smoke will be death to many things. *Lysimachia nummularia aurea*, the golden-leaved form of the well-known Creeping Jenny or Moneywort, makes one of the brightest golden-yellow carpets imaginable, most effective where judiciously introduced amongst green-leaved plants. How the public have taken to single Dahlias may be judged from the fact that up to the end of May over 21,000 of them have been sent out from the Hale Farm Nursery alone.

The Rosery.

GARDEN ROSES.—The objection to Rose growers is often made, that so much attention has been given by them to exhibition Roses, that nothing is considered in these days as deserving of any consideration unless it be of a particular shape, size, and colour, so as to fit it for being placed in a formal stand along with a certain number of others of similar character, to be submitted to critical eyes, and judged according to certain clearly defined rules, and to this is added the cry, "We want 'garden Roses.'" This cry proceeds from different quarters; there is the class of persons who resent as a personal affront any attempt to improve upon Nature, to whom anything double is an abomination, who can talk of the preciousness of a single flower, and go into ecstasies over a Sunflower or a Daffodil, but who turn away with well affected disgust from such abominations as a florist's Pansy or Picotee. Then there are those who, having broken away from the geometric, ribbon, and carpet-bed system, feel bound in duty to rush into the opposite extreme; and it therefore sometimes occurs to me that when people cry out for garden Roses there is a certain vagueness in their demand of which they themselves are unaware.

Definitions are grand things: it saves a world of time and a lot of words if one can only get people to agree together as to what they mean—for it may be found after a considerable amount of skirmishing, that we entirely differ as to what we were fighting about; when, then, a person says that he wants garden Roses, what does he mean? Does he mean Roses that shall give a brilliant mass of flower at one time, making the garden gay with colour, or sweet with perfume; does he want single Roses like the wild Brier, or the Japanese rugosa? Does he want Roses that shall run wild over everything; or is his ideal Rose one which is to combine all these qualities? I have seen some vague aspirations that seemed to imply that all this was expected, and that especially among some of the species which had as yet been uncontaminated by the hybridiser we were to find the perfection of a "garden Rose." All this is, I dare to say, an idle dream; nay, more, I am prepared to say that if you want garden Roses for decorating and perfuming your parterre with bright colours and delicate odours, you must mainly look for them amongst those Roses with which the skill of the hybridiser has enriched us. No one would ever dream of banishing the delightful moss Rose; although its period of blooming is so brief, and its opened berries are not such as its budding charms gave promise of. The grand old cabbage Rose, the little Rose de Meaux, and it may be a very few of what are called summer Roses, must come under the term, but I do not think that they will satisfy those who want something more lasting and permanent to enrich their gardens with. What, then, are our requirements? We must in the first place have perfume—"A Rose by any other name would smell as sweet" shows that the very first idea associated with the flower is its perfume. The moment we are presented with one the instinctive action is to sniff up its perfume, and so I should be quite prepared to dismiss from any claim to be considered as garden Roses some of our most beautiful exhibition flowers; the lovely Baroness Rothschild, Victor Verdier, Monsieur Noman, and all of what are called the Victor Verdier blood, must be "tabooed;" indeed, I do not think that even exhibitors will be satisfied until they obtain flowers with as much beauty of colour and form as these and others of the same type, but with that one qualification which they lack. Then I think we ought to have continuance of bloom. The term hybrid perpetual is a misnomer, the true distinction between them and summer Roses being that the latter gives at once a grand mass of flower, but that the shoots which start forth after this are utterly flowerless. The hybrid perpetuals, or many of them at least, act differently. They give us their grand blooms as their first effort, but as they start for growth they take with them in many instances a second crop of buds, while later on in the autumn others succeed to them, so that it

is not too much to say that any one who has a tolerably good collection of Roses can from June to November always find some Roses in his garden worth gathering; and this property of second blooming is more properly expressed by the French term *remontante* than by our English equivalent hybrid perpetual. Then a good garden Rose must possess organs of constitution and freedom of growth; to have a miffy, neat-growing Rose would certainly not conduce to decoration, leaving out of sight altogether the disappointment and annoyance such plants occasion; their very existence in a garden is an anomaly, and although some are yet tolerated by exhibitors on account of some excellence, in fact, the idea is fast laying hold of them that they must give way to better constituted and more vigorous growers. This would, then, dispose of some very beautiful Roses, such as *Horace Vernet*, which are only good even for exhibitors on maiden plants; and some of our very prettiest Tea Roses must in the same way relinquish their claim to being considered garden Roses, although I think it is in this class or in *Noisettes* that we shall find those which will best satisfy the many requirements of a good garden Rose.

If we take, then, those which are of rampant growth, delightful for running up the side of a house or pillars, or making *Rose arbours*, we must take grand old *Gloire de Dijon*, somewhat straggling in habit, but good in all situations. *Maréchal Niel*, glorious as he is, is not an out-of-doors Rose; his proper place is running along the rafters of a house, where his golden cups hang down over your head. The yellow Rose which I value most for covering a wall is *Rêve d'Or*, when true; it has most beautiful foliage, a good habit, not with long straggling shoots, but close, well covered ones from the very root up. When I say that previous to the cruel winters of 1880 and 1881 I had one that had run up to the very eaves of my house, 30 feet, that it half covered two sides of it, and that I am sure it had not less than 3000 blooms on it, it will be readily conceded that I have good reason to praise it. Then we must not forget *Cheshunt Hybrid*, for whatever its parentage there is no doubt of its excellence as a garden Rose. I have seen it in all situations in the United Kingdom, and everywhere it is a good and valuable Rose. *Bouquet d'Or* is another of the very free flowering Tea or *Noisette* Roses, which has large and well formed yellow flowers; so, too, is *Belle Lyonnaise*, although its flowers have a great tendency to come quartered. *Setina*, a new Rose, is highly spoken of; the climbing *Devoniensis* is surely a garden Rose, but beware of imitations—there is a rampant kind which will grow to any length, but is chary of blooming, but *Pavett's* variety will grow 8 or 10 feet, and is very free flowering. We have also climbing *Charles Lefebvre* and climbing *Jules Margottin*, vigorous sports of grand old Roses, bright and fresh in colour, and *Longworth Kambler*, a very free small flowering climber.

Then with regard to Rose bushes—*i.e.*, dwarf Roses—which shall decorate the garden, we must try to have those which bloom well in autumn, but I think, from what I have noted in the gardening papers and from my own observation, that situation and season have a great deal to do with this, and it would not, perhaps, be very easy to give a reliable list. Thus I have seen one writer recommending *Alfred Colomb* and *Marie Baumann*; now I rarely if ever get an autumnal bloom from these, and they are both so delicate in habit that they cannot be considered as garden Roses, however grand they may be as exhibition flowers; while *Captain Christy*, also recommended, will so little stand weather that it cannot fairly be included. I should recommend *Aimé Alexiéf*, an old Rose; *Comtesse de Chabrillant*, lovely in form; *Jean Cherpin*, violet; *Souvenir de Charles Moutail*, dark; and *Jules Margottin*; but I think in this matter if a grower finds that any of the strong growing hybrid perpetuals flower freely with him, by all means use them.

In single Roses, we have *Austrian Yellow*, moderate in growth; *Prussian Yellow*, free, beautiful in colour and vigorous; *Kosa rugosa*, and its var. *alba*, the Japanese Rose, very lovely, both in flower and fruit; *Rosa pyrenaica*, delightful for rockwork; and to these we must add the old *China* and its relative *Cramoisi supérieure*, and a Rose now rarely seen, *Mrs. Bosanquet*; and the new little *Paquerette* or *Daisy Roses*, very free and very pretty. The *Macarney* Rose, beautiful as it is, is generally too tender and requires a wall, but the *Scotch Perpetual* is well deserving a place in any garden. *Wild Rose*.

Orchid Notes and Gleanings.

AMONG THE ORCHIDS AT MANCHESTER.—The last Whitsonide exhibition of Orchids at Manchester was doubtless the most remarkable floral display of the kind ever seen in this country. There was quantity and quality of a kind to command and rivet the attention of the most superficial observer, but, notwithstanding all this, there were several species of well known plants flowering at this season of the year that were "conspicuous by their absence." There were no *Saccolabiums*, no *Phalenopsis*, no *Vandas* of any note, barring the Dalkeith variety of tricolor shown by Mr. Hardy; no *Aerides* in quantity—in fact, East Indian Orchids of a distinctive character were barely, if at all, represented in those lines upon lines of plants that graced both sides of the large exhibition house. It cannot be because these old species are dying out, for *Phalenopsis* are coming by their tens of thousands, and so are *Saccolabiums*, and so are *Aerides*; and the question naturally arises, Why is it so? It must be because the *Cattleyas*, the *Odontoglossums* of the *Eudontoglossum* type such as *veillarii*, the *Dendrobiums*, the *Masdevallias*, and the *Cypripediums*, are much easier "bedded out" to make a grand display. And here comes the rub, Where is this bedding-out to end? No exhibitor can do without it, no caterer for the public, in the position of Mr. Findlay, for instance, can afford to put his heel upon it, no judge can ignore it. The question, therefore, arises, What's to be done? It must go on, I suppose; but there ought to be some limit to size of pot, else we shall have, instead of sixteen plants, sixteen miniature circular beds of flowers, and the biggest grower, and the biggest purse, will swamp all the lesser growers in the kingdom. There is as much difference now between plants that were exhibited in point of size and plants that are now systematically made up, as between the old small hand-bouquet that ladies used and the one of the present day, which, with a little variation, would make a useful parachute. The gardening element will naturally say, Why need I struggle to grow large single plants when my neighbour next door can make double the show of flower by lumping a dozen or two together, and my skill goes for naught? That is a difficulty that gettersons of schedules require to study, else growers of limited collections of Orchids will never put in an appearance, at least if they do so once or twice and quitte both employer and employe! will get soured. I hate admit it is a difficult matter to frame a schedule to give general satisfaction, and at the same time command a display such as was shown at the Manchester exhibition; but there ought to be something done to encourage the cultivation of single plants. [Certainly, Ed.] For excellent culture of individual plants I might point now to the *Dendrobium Wardianum* and *Odontoglossum crispum* in Mr. Hardy's group, to the same latter species in Mr. Walker's, and to by far the finest *Lælia majalis* I ever saw, in Mr. Brown's group, which doubtless charmed the eye of every Orchid grower. If it is not practicable to offer prizes for them in the one case or get them in groups of half-dozen or so from one exhibitor it would be an easy matter to offer extra prizes to such distinguished plants, apart altogether from the groups in which they are shown. *James Anderson, Meadowbank.*

— ORCHIDS AT HOLLOWAY. — Mr. B. S. WILLIAMS' houses are very gay just now, and so many fine plants are showing for bloom that for another month at least the collection will contain things worth seeing. In the *Cattleya*-house are several fine examples of *Lælia purpurata* in variety. One has eight spikes of flowers, the rich colours of the lips of which make an effective contrast with the clear white sepals and petals. In another plant these organs are rose-tinted, in the way of *Williamsiana*, and there are five flowers on the spike; while yet another resembles the last in all but its larger lip, which contains a large blotch of lilac. The collection of *Cattleya Mossiae* includes a variety with a large lip beautifully veined with orange, purple, and chestnut right up the throat; and *Chysis aurea* is attractive, from its pretty orange

and buff-coloured blossoms, with crimson-spotted lips. The entrance to the *Vanda*-house reveals a wealth of blooms that is very delightful. Here are examples of *V. suavis* with four spikes on a plant and fifteen flowers on a spike; *V. tricolor insignis* with three grand spikes; and *V. tricolor* with three and four spikes each, &c. A fine piece of the rare *Dendrobium Schroederi* is just going off; *Cypripedium superbiens*, one of the best of the *barbatum* section, is in nice form, as also is the sweet and pretty *Aerides crispum*. *Cypripedium caudatum* with six spikes takes the eye as a good specimen, and a fine variety of *Dendrobium suavisimum* is conspicuous for its large and well-defined blotch on the lip. In the cool-houses the rare *Odontoglossum Horsmanni* is in bloom, and stands out distinctly among the *crispums*, its flowers being white spotted with bright chestnut. The scarce *O. Coradinei* also claims notice; and then the *Masdevallias* demand attention, the varieties of *M. Hararyana* being especially well represented by the true Bull's-blood var., *violacea*, *Dennisoni*, and *lutea*—all fine plants in beautiful bloom, and will bud enough to continue the supply for some time to come.

CATTELYAS AND ODONTOGLOSSUMS AT MR. BOCKETT'S.—There is a grand lot of *Cattleyas* in flower here, including an endless variety of *C. Mossiae*, of which fine old kind there are some of the largest and finest marked forms we have met with. Of *C. Mendeli*, which is alike variable in both the size and marking of the flowers, there are several beautiful varieties, possessing plenty of substance and highly coloured. Also the scarce *C. lobata* and *C. Regnelli*; an unusually strong example of this, with a bulb nearly a foot long, was bearing four flowers to one spike. In company with these was the large-bulbed variety of *Lælia purpurata*, with pure white sepals and petals. Grown in the same house are a fine lot of *Aerides Fieldingii*, near on a dozen plants of which were in bloom, along with the scarce and singular *Vanda cristata*, a couple being in flower. *Cattleya* treatment suits these kinds as also *Vanda cœrulea*, several fine examples of which kept close up to the glass as healthy and free from spots as can be. A batch of *Aerides crispum* in unusually strong pieces have made a year's growth in the same house such as confirms the now acknowledged fact, that it does best when not kept too hot. A nice form of *Epidendrum prismatocarpum* was also in flower. The principal *Odontoglossum*-house, 100 feet long, will shortly be a sight such as not often met with, notwithstanding the extent to which these favourite Orchids are now cultivated. Although much the greater number are yet to flower, already there are scores of racemes open of such size as only to be seen where the plants have attained size and strength to show their true character. The collection is unusually rich in fine forms, or, rather, it may more correctly be said there is an absence of the indifferent varieties generally plentiful where such quantities of these Orchids are grown. When it is stated that the plants are four or five rows deep on each side of the path of this long house, and that the whole consist of the cool section of *Odontoglossum* and *Masdevallias*, with a few other species requiring a similar temperature, and that the great bulk have attained a large size, some idea of the display may be imagined. The *Masdevallias* are in equally fine condition; amongst them are numbers of splendid forms of *M. Hararyana*, *M. Lindeni*, *M. Veitchii*, of the true Bull's-blood variety, originally bought at the Meadowbank sale. There are three good plants in strong vigorous condition, one is just coming into flower; this is undoubtedly not only one of the finest, if not the finest, of all the *Masdevallias*, but, still finer, is among the select few species that stand at the head of the whole Orchid family.

ANGULOA CLOWESII.—We very much doubt if since this Orchid first flowered in 1843 so grand a flowering specimen has been seen here or elsewhere as is that now in flower at Mount Anville Park, Dundrum, Dublin, the residence of Henry Roe, Esq. The plant, which is growing in a pan of the largest size, is fully 4 feet through and 12 round. It is in the highest health, and showing thirteen or more fresh growths, while round the circumference of the leafy centre no less than sixty-five flower-scapes, each capped with its great cymbiform cup of golden or most pronounced æsthetic yellow, the whole forming a picture the plantsman who has seen it is not likely soon to forget. We may fairly congratulate Mr. Roe on the possession of such a specimen, and his excellent gardener, Mr. Fisher, on what must be regarded as a triumph of cultural skill. The plant is grown in an intermediate-house, the potting material being peat, loam, and charcoal—good, wholesome food, which Mr. Fisher did not care to supplement or moisten with other stimulant than Varry water. *Lish Farmers' Gazette.*

The Kitchen Garden.

SEED SOWING.—Sowings of Broad Beans and Canadian Wonder French Beans, also Endive of the broad-leaved and green curled type, and Walcheren and Veitch's Autumn Giant Cauliflowers, should now be made; as also Mustard and Cress, and Radishes, which, as previously recommended, should be sown every fortnight or three weeks during the summer. And about the end of the next, or early in the following week, make another sowing of Scarlet Runners on the south side of the preceding row, assuming that it runs east and west, and in the event of the row running north and south, the next sowing should be made on the west side; but the former position (respecting which full particulars were given in your number for April 15, and at p. 498) is unquestionably the best, inasmuch as the first row protects the second. Make another good sowing of the late varieties of Peas for use from the middle to the end of September, and about a week later a sowing of any of the second early varieties should be made to supplement the gathering from the preceding sowing, and for this purpose Dickson's Favourite and Laxton's Supreme are two suitable varieties; as also, for sowing a few days after the last-named varieties, are Sutton's Kinglerd, Emerald Gem, and William I. Successional sowings of Turnips, Carrots (Nantes Horn) for autumn and early winter use, and Lettuces of the Cos and Cabbage varieties, should also be made, and subsequently attended to when necessary in the way of watering, protecting from the ravages of birds, &c.

BROCCOLI, &c., PLANTING.—This will be a good time for getting good breadths of Broccoli and autumn and early winter Broccoli planted. Of the Broccoli, the dwarf curled Scotch and Cottagers' are unquestionably the best and most hardy varieties; but it will not only be necessary to determine what variety to grow, but also to consider how best to grow our plants to withstand the effects of a severe winter. The first step to be taken in this direction is to have the seedling plants, as recommended in a former Calendar, transplanted in nursery beds before they have become crowded in the seed beds, and thence, as soon as the plants have thoroughly established themselves, and before they get crowded, finally planted out and watered until the plants have taken hold of the soil. In planting, the plants should be buried to the collar, the object being to keep them dwarf, and as near the ground as possible, so that in the event of a fall of snow and its being accompanied, as unfortunately was the case a couple of years since, by a spell of frost, the plants may come under the protection of the former. Moreover, it is a fact that cannot be too well known, that it is the stems of Broccoli, Borecole, and kindred plants, that suffer most, and that where these, through habit or cultivation, are dwarf, the losses through frost are inconsiderable; hence the object and advantage of growing dwarf sturdy plants. Borecole will succeed moderately well in almost any garden soil and position, but where a good well-manured open piece of ground can be given to it the quantity and quality of the crop will be considerably increased. The green curled Kale should not be planted closer than 20 inches between the plants in the rows and 2 feet between the latter; and Cottagers' Kale should be allowed from 9 to 12 inches more each way. Broccoli.—Of these the following varieties, with Walcheren and Autumn Giant Cauliflowers, make a good succession, of which a good planting of the respective kinds should be made forthwith, in ground prepared the same as for Cabbage and Cauliflower plants, in drills 2 feet asunder and at the same distance between the plants in the rows, viz.:—Grange's Autumn, White Cape, Early Purple Cape, Veitch's Self-protecting, Dancer's Late Pink Cape, Snow's Winter White, and Early Penzance. The later and stronger-growing kinds of Broccoli should have from 6 to 9 inches more room between the plants each way, if that space can be afforded to them, and should be planted in ground from which Peas and old Strawberry plants have been cleared, and, in order to facilitate the planting process, in holes made with the crowbar. In planting Broccoli plants, some kind of classification of the respective kinds, and the time at which they come in for use, should be observed, so that the crops may be taken, and the ground become

vacant, in regular succession, thereby rendering the ground available for trenching, &c., at the proper time. Make another planting of Early London and Veitch's Autumn Giant Cauliflowers, and protect the heads of those now coming into use, with the leaves, from the full force of the sun as a means of retarding the crop; also plant out the necessary quantity of dwarf Savoys in rows 15 inches apart, and 12 inches in the rows, and make another planting of Brussels Sprouts. Capsicums, where much in demand, may now be planted out under a south wall in a bit of rich soil, which should then be watered to settle the latter about their roots. It is a good plan before planting any of the Brassica family to dip the roots in a puddle made of ordinary garden soil, with sufficient clay added to render it more adhesive, and to which a few handfuls of soot should also be added. This will have the effect of saving the roots of the plants from the attacks of worms, which last year were very troublesome and destructive to the roots of freshly planted Cauliflowers and Cabbage plants here and elsewhere; but since we had recourse to dipping the roots in the liquid compound of soot and clay, we have had no further trouble in this direction, and this is due, no doubt, to the agency of the soot.

GENERAL WORK.—This will consist of the earthing-up of Brussels Sprouts, Cabbages, Cauliflowers, Broad Beans, French Beans, and Peas, together with the staking and mulching between the rows of the latter with rotten dung, the watering of seed-beds, seedlings, and freshly planted plants, and ranks of Peas and Beans, and Celery, when necessary; Vegetable Marrows and ridge Cucumbers, which should now have the hand-glasses raised by placing a brick-bat under each corner and the shoots taken out underneath in different directions, will also, in the absence of rain, require copious supplies of water at the roots, and recently transplanted herbs will require attention in the same direction, as also will Tomatos out-of-doors. Clear the ground of early Peas as soon as the crops have been gathered, and manure and dig it for French Beans or other crops. *H. W. Ward, Longford Castle, Wilts.*

NOTES ON VEGETABLES.

EARLY AND LATE PEAS.—Among vegetables there is no crop to which greater importance is attached than early Peas, and as this is the best season to compare notes as to the forwardness of particular kinds, I send mine as a first instalment, in the hope that others may do the same and give dates when the Peas were sown and the time when each sort was ready for picking. As our earliest lot were sown in boxes of silted leaf-soil and planted out after being nursed-on in frames, I shall omit further mention of them and turn to those sown on an open border on January 16, which border is a sunny one under a south-east wall, where early Peas always do well. The kinds we have growing there are Kentish Invicta and William I., both of which were put in on the same day—the date mentioned above, and on June 3 we gathered a good dish of Invicta, and though William I. is following very closely on its heels, pods of it will not be full enough till four or five days more have elapsed. This shows clearly that the Kentish Invicta is the earlier Pea of the two, and this has been my experience of it for years past, and for colour and quality I like it better than any other variety I have yet tried. William I. is better in both these respects, and should always be sown with it, as it is a valuable Pea, that is not only first-rate in colour and good in flavour, but it is a prodigious bearer where it has a good soil and plenty of room. The way these and all other Peas do best is when sown at wide distances, which need not involve loss of space, as Spinach, Lettuce, or any similar dwarf crop may be sown or planted between. Day's Sunrise, though not so early as either of the above-named, is an excellent Pea, possessing more of the Marrow character, and has large well-filled pods of whitish Peas, that are sweet and delicious when cooked. For field culture, or to grow as an early market Pea, I should take it to be the best, for, besides the qualities mentioned, it is of dwarf compact habit, and a capital bearer. Sown side by side with Advancer on Jan. 16, it is a good week forwarder than that sterling variety, and, judging from present appearances, there will be a fine lot for picking about the middle of June. To succeed these we sow Veitch's at the same time, and every week after a row or more of Tele-

phone, Ne Plus Ultra, or British Queen, keeping chiefly to the latter for late work, as we find it withstands mildew better, and fills its pods well into the autumn. *J. Sheppard.*

Plants and their Culture.

STOVES.—Any stock of stove flowering plants that may be relied on to give a display during the summer months must receive every attention, both in regard to cleanliness and general cultivation. Plants of Allamandas that have been stopped as previously recommended will, in some cases, be "knotting" for flower. When this is seen to be the case, occasional doses of liquid manure will be beneficial, and should be more liberally supplied as the plants advance into flower. Some growers make it a practice to keep the shoots of these plants tied in close to the trellis as they advance in growth; but this is a mistake, and should not be done until the flowers begin to show colour. Where the tying-in process is followed, many shoots will either turn blind or never show any flower at all, especially if bent in a downward position. On the other hand, the growths of these plants should all be encouraged in an upward direction, and as near the glass as possible, so that they receive the maximum amount of light and sunshine. These remarks also especially apply to Stephanotis, Bougainvilleas, and Dipladenias when grown as specimens in pots.

Where Ixoras are putting up their flower trusses, see that the plants have a thorough cleansing previous to their development, if any mealy-bug is about. When this insect gets into the trusses, the flowers will the more quickly fade and drop off. Plants of Hoyas, Cyto-ceras, and such-like subjects, that retain their flowering growths from year to year, should also be kept as clean from insects as possible. The truss of a Hoya is a favourite place for the bug, adhering to the flowers after they fall till they can find fresh quarters. In syringing the leaves, &c., of these plants be careful not to damage the point of the flower-truss, or it may be injured for the future. Pentas carnea and kermesina are useful summer flowering plants; these should be liberally treated—young stuff will be found the most serviceable. Red-spider is at times troublesome among these, as it is also on Vincas; the free use of the syringe will, however, keep this enemy in check. Where the last named plants have attained to a flowering size pinching the points of the shoots may be discontinued, and when the first flowers open the plants should be deluged in water, with stimulants occasionally. With this treatment and under ordinary stove temperature they will develop flowers as large as a crown piece. These should be kept constantly picked off as they fade, or the succeeding blooms will be injured by the decaying of the old ones. Sharp watch must also be kept for spider on Thunbergias and Meyerias. These are handsome subjects when well grown, but are a prey to insects. The temperature of the stove should now be at the maximum, say 70° for night, 80° to 85° by day, closing at the latter quotation on all favourable occasions. Fires ought not to be dispensed with yet, if the wellbeing of the inmates of the stove is to be studied.

PLANTS FOR DECORATIVE PURPOSES.—Where any considerable quantity of plants for the above work has to be supplied for indoor use in the filling of vases, ornamental baskets, and in groups, a good stock should be kept up of two or three of the best of the Selaginellas, as *S. Kraussiana* (dentulata) and *S. cressa*. *S. apoda* and *Martensii* are also useful, but not so well for rough treatment. Some pots of cuttings of *Panicum variegatum*, *Tradescantias* in variety; *Ficus repens* and minima, *Saxifraga sarmatensis*, and *Isolepis gracilis* (if division) will all be found useful for a finishing touch to any arrangement. These as they become shabby may be cast aside as long as a young stock is coming on. Stocks in small pots are always acceptable, *Mignonette* also, and *Heliotropes* with *Aloysia citriflora*. Where suchlike plants are grown for these uses, the stock of more permanent plants of slow growth, hard-wood subjects, and the like, will frequently escape injury, whereas soft-wooded stuff and annuals can be consigned to the rubbish heap, to make room for another supply. *Aspidistra larida variegata* is one of the most durable

of plants for a room, and ought to be propagated extensively either for this purpose or for conservatory decoration. Of Ferns, *Pteris serrulata* and *unilobosa*, *Asplenium biliferum* and *flaccidum*, *Niphobolus ligula* and *Davallia bullata* are all good and durable kinds; and of Palms *Phoenix reclinata* and *Corypha australis* are among the best and hardiest. *James Hudson, Gunnersbury House, June 6.*

The Orchard House.

OUR house is a useful structure for many other plants besides fruit trees. Many large specimens of half hardy plants and trees are sheltered for the winter; and this season the cold east winds have prevented us turning out some that ought to have gone out long ago; they must remain in no longer, as the fruit-bearing trees require all the space. Our plan is to turn out all that have not a crop of fruit set upon them, reserving all the space for those that will bear a good crop. In many cases, fruit trees are placed far too close together. If there was room in the house for twenty trees to develop themselves well, with sufficient space for light and air, and it contained twenty-four trees, rather than they should be over-crowded I would destroy the four trees; but in most gardens there would be room for them in a good position out-of-doors, and early fruiting varieties would be the best for that purpose. Our Peach and Nectarine trees have nearly passed through the stoning period, and in our whole large collection of about thirty varieties not one has dropped any fruit. If the trees had been overloaded, or if they had received any check, such as lack of water at the roots or neglect to open the ventilators in the morning, no doubt we should have had another tale to tell. As soon as the fruit begins to swell apply the surface dressing recommended at p. 531, and the temperature may also be raised considerably, both by night and day. Artificial heat may be applied if it is necessary to get the fruit a few days earlier. Syringing the trees well night and morning, and fumigate if there is much greenfly on them. The fumigation must be attended to before the fruit becomes soft, indeed they ought to be quite clean by this time. The Strawberry plants on the shelves are now ripening off their fruit, and this rather prevents us from syringing the trees so freely as we would, as the ripe or ripening fruit is rather injured by the wet on it. It is also very difficult to keep the leaves of the Strawberry plants free from red-spider, and this pest gets from them on to the fruit trees, so that it is best to get the plants out of the house immediately the fruit is all gathered from them. Pear, Plum, and Apricot trees may now be removed out-of-doors, into a position sheltered from high winds, if there is not room for them in the house; but if room can be spared, the fruit is of much better quality when ripened under glass. The young growing shoots ought to be stopped as often as they require it, and in many cases it is also necessary to thin them out. In the Calendar of Operations by the late Mr. Rivers, of Sawbridgeworth, he says, "On the 10th, and again on the 25th of June, lift the pots to break off the roots and prevent them going too deeply into the border." I never allow the roots to grow outside the pots; our trees have their pots raised on bricks in a way that allows the air to draw underneath the pots. *J. Douglas.*

Peaches and Nectarines.

As the trees in the early houses become cleared of fruit, give them a thorough washing with the engine or the syringe to clear them of red-spider, which generally makes its appearance in strong force during the time the fruit is ripening; keep them as cool as possible by throwing the ventilators wide open, to prevent the wood getting too ripe, as with the hot sun we have had this season they are very forward already. Still keep them well supplied with water at the roots, and any trees that are very weak from overcropping or other causes may still have a supply of weak manure-water. Treat the second house according to the directions already given for the early house, when in the same stage as the second one now is (taking their last swelling). The directions given in the last Calendars still apply to succession and late houses. If not already done, trees in late houses may have a good mulching of half rotten manure, and be well watered afterwards. *J. Wallis, Keele Gardens.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 13	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.; Evening Rec. at 8 P.M.
WEDNESDAY, June 14	Branche Horticultural Exhibition (two days). Linnæan Society meets at 8 P.M. Sale of Glass Erectors, &c., at the Barrack's Green, Bursary, Stoke Newington, by Frotheroe & Morris.
THURSDAY, June 15	Sale of Imported Orchids, at Stevens' Rooms.

A WRITER in the current number of the *Gardener* details the results of his recent visit to Sherwood, near Tunbridge Wells, where Mr. BUCHANAN, under the direction of Dr. SIEMENS, is continuing the experiments with the ELECTRIC LIGHT, to which we have before called attention. The reporter is not favourably impressed with the power of the electric light as a help to gardeners, and no doubt, looking at the matter purely from a practical and immediate point of view, the writer is perfectly justified. The matter has not yet passed out of the experimental stage, and it seems as if it would be a long time before it would do so. So far the experiments have not been sufficiently comparative, nor have they been carried out with that precision, definiteness of purpose, appropriate adaptation, and selection of subjects which the great importance of the subject demands. All such experiments should be carried out at first with a purely scientific aim. The cost should be accurately estimated, but it should not be allowed to influence the experiment in the first instance. It is much to be regretted, in this connection, that the recent electrical exhibition at the Crystal Palace should have been allowed to terminate without some effort having been made to test the power of the light as a possible future aid to the gardener.

Passing over some cases in which, this season, the electric light, as tried at Tunbridge Wells, has done no good—and from which negative evidence outsiders can reap no benefit, though those entrusted with the experiment should do so—we find it admitted as probable that three William Tillery Melon plants grown in a low pitched Cucumber-house, and exposed to the light, produced ripe fruit earlier than others in the same house which did not get the benefit of the light, although six week younger than the others. This looks like a substantial advantage, and at any rate it is hopeful. As to Strawberries, we are told that three batches were started at the same time in November, 1881: one batch has since been grown under electric light only (it is not stated whether the plants were illuminated at night); another batch has been submitted to daylight only, and a third lot to daylight and electric light. The two former batches were stated to be equal; if so, the electric light has no advantage over daylight. The third batch, subjected to constant illumination, daylight and electric light, "was decidedly earlier than the others, and was ready for eating on the 26th January, 1882." Similar results have now been obtained from repeated experiments with Mustard, treated in the same way as the Strawberries. Sunlight, as might have been anticipated, is preferable when it is available, but when the days are overcast, and the sun shrouded, then plants grown with the electric light will be earlier and better than those grown without such adventitious aid.

We do not gain much information from the mere fact that a Strawberry or a pot Rose, whose flower-buds were formed long before it was submitted to the light, has had its development hastened by such exposure. We want to know what would happen to the plant if it were continuously grown from the beginning under such conditions. What would happen to it next year? It would be interesting to know if any of the Melons and Cucumbers grown continuously under the light produced seed of good quality, and, if so, of what character were the seedlings. Mr. BUCHANAN can probably enlighten us on

these points. It is also greatly to be desired that a series of plants should, if possible, be grown from the seed to the seeding stage again, under the electric light, and that the size, weight, measurement, and whole life history of such plants and of all their organs should be accurately observed and faithfully recorded in comparison with those of other plants grown under natural conditions and at the same time.

It is really a matter of the greatest importance in vegetable physiology to ascertain precisely what is the effect of growing a plant under continuous light. The prevalent notion among physiologists is that light retards growth—that a plant feeds by day by virtue of the sunlight, and uses up at night the food so gained, or rather that which has previously been so gained and stored in the tissues. At first sight it seems as if this opinion must be in direct contradiction to facts that come under our daily observation—that it must be directly contrary to what is observed in the short summers but nightless days of the far North, where for a few weeks the plants are constantly exposed to light, and where, in consequence, growth and harvest operations occupy a much shorter time than with us. It would seem also that the results already obtained by the aid of the electric light are directly contradictory to the opinion of the physiologists. But the divergence is not so great as it appears. Laboratory experiments are one thing, ordinary cultural experiments are quite another. It is the object in the laboratory, as far as possible, to study the influence on plants of light only, or of heat only, or of moisture only, to isolate each factor of a plant's growth, and study it by itself—see what it does, and what it does not do when separated from other agencies. In Nature, or under ordinary cultivation it is quite another matter. All the forces of Nature come into play, and fashion the plant by their combined influence. The action of light is controlled by that of heat and moisture, and so the plant is the result of the concurrent operation of many forces, and it varies in character and in the way it does its work according as it is equally or unequally influenced by these agencies.

It is rash at present to speculate, still more so to dogmatise, as to the absolute necessity for rest in plant-growth—we know how desirable it is sometimes—rash to affirm that periods of darkness are absolutely essential to their health. On all these points we want accurate information, and should welcome it from any source.

For immediate practical purposes we need not, however, be so exacting. It is for early forcing purposes, as we have before said, that we imagine the light will be found most useful. It is now established sufficiently that the light, properly applied, will supplement the daylight and afford light when the sun does not, and that in so far it will hasten vegetation and promote the more rapid ripening of fruits. But whether it will do so at such a cost as to allow of commercial success is a point that has not yet been satisfactorily answered. Again, as practical men, looking at matters from a commercial or an economic standpoint, we are not concerned in the first place with what is good or bad for the plant. It is not good for the Strasburg geese or prize pigs to be over-fed, over-heated, and under-exercised—on the contrary, it is very bad for them, and so our cultural proceedings may be very bad for the plant: it may be worth our while, as indeed it is, to grow plants under conditions wholly unsuitable to them in a natural state, so that the circumstance that the electric light may prove injurious to plants affords no argument whatever against its use. If it is once made clear that it is worth our while to avail ourselves of it, we can soon adopt means to compensate for any injury it may occasion.

— THE SUCULENT HOUSE AT KEW.—Visitors to the Royal Gardens, with their curiosity whetted by the sight of Miss NORTON'S remarkable series of

illustrations of characteristic plants in various parts of the world, may find confirmation of the artist's fidelity, and realise in a measure the effect of the association of plants of similar contour and habit—such as HUMBOLDT called physiognomical plants—by entering the Succulent-house. Our illustration (fig. 118) taken from a different point to that shown in our New Supplement some years since, shows the magnificent group of Agaves, Foucroyas, Beaucarneas, &c., which occupies one end of the house, and forms one of the most striking features in a garden which is full of such attractions.

— MR. W. T. THISELTON DYER, C.M.G.—We are pleased to have to announce that in recognition of the services rendered by the Assistant Director of the Royal Gardens, Kew, to the various Colonial Governments, the honour of Companion of the Order of St. Michael and St. George has been conferred on him. The ordinary visitor to Kew has little idea of the magnitude of the labours undertaken at Kew in the service of the Indian and colonial botanic gardens and plantations.

— HYBRID CERESUS.—From Mr. FLEMING, of Clivenham, come flowers of a very beautiful Ceresus—a most aristocratic-looking flower, as a lady critic asserts. The plant is a hybrid between the rich crimson Ceresus speciosissimus and the very lovely night-blooming Ceresus, but in which direction the cross was effected we do not know. In any case, the result is a flower of singular beauty, the narrow, sharply pointed outer segments varying in colour from cream coloured to orange-brown, the outer or lower surface of each being the more highly coloured. These pass imperceptibly, and without any sudden break, into the broad obovate oblong pointed inner white segments of the corolla. Within these is a crowd of delicate white filaments of different lengths, and in the centre a long pure white columnar style split up at its apex into about ten short white velvety stigmas, radiating like the lobes of a star-fish. The flower has the beauty of the night-blooming Ceresus but with less pure yellow or orange in the outer segments, and, in addition, has the advantage of flowering in the day-time, and with less heat, though our enthusiasm has many a time kept us from our couch watching the unfolding of the amazing beauty.

— THE PARIS FLORA.—M. COSSON & G. MAIN DE SAINT PIERRE have lately issued a second edition of their *Atlas de la Flore des Environs de Paris* (WILLIAMS & NORGATE). The fidelity of the illustrations and the neatness of the engravings are very remarkable, so that many British botanists will be glad to possess a pictorial record of a flora in many respects identical with our own. The book contains forty-seven octavo plates, each with numerous figures, so that a large number of those species which are the most difficult of determination are figured, while, still further to assist the student, analytical tables are given showing how to discriminate between nearly allied species.

— EUCALYPTOGRAPHIA.—Baron VON MUELLER continues his very useful descriptive atlas of the Eucalypts of Australia. The eighth decade is before us, containing figures and descriptions of *E. condata*, *E. crythronema*, *E. gamophylla*, *E. macrocarpa*, *E. Preissiana*, *E. pruinosia*, *E. pulverulenta*, *E. pyramidalis*, *E. santalifolia*, *E. sepulchralis*.

— SEEDLING PELARGONIUMS may be submitted in competition for the Pelargonium Society's Certificate of Merit at the meetings of the Royal Horticultural Society's committees at South Kensington on Tuesday next, Mr. HIBBERD, 15, BROWNWOOD Park, Stoke Newington, Secretary to the Pelargonium Society, will supply entry forms for seedlings, and whatever else may be required by intending exhibitors.

— THE PALERMO BOTANIC GARDEN.—Prof. BARON TODARO has recently issued a *fasciculus* of his publication entitled *Horæ Botanicas Tamaritanæ*, containing the description and folio coloured illustration of *Agave macrantha*, a species with thick oval acuminate spine-tipped dentate leaves, and yellow flowers, with long pinkish protruding stamens; as well as of *Ophrys* (arachnites) *Benotii*, and *O. fuciflora*—terrestrial Orchids nearly allied to our *Iris* and *Diandra* Orchises.

RHODODENDRON GRANDE

JAMES E. SMITH, D.

The Garden's Terrace.

FIG. 118.—THE SPECTACLE HOUSE AT NEW. (SEE P. 77.)

— THE GUM CISTUS.—Beds of these in this season are very attractive in extensive pleasure-grounds, for they are hardly suitable for a small garden, owing to their habit and mode of growth. A single plant is often very ornamental, but given a good-sized bold bed of them located between specimen Conifers, they supply a mass of colour which is very acceptable and distinct in form from most other things that flower at the same time.

— THE MARKET PEA CROP.—Peas promise to be both cheap and plentiful this season. That can be hardly other than good news to consumers, especially to the poorer section of the public, to whom fresh new vegetables, and Peas especially, come as a welcome boon, invigorating and health-giving. Under ordinary conditions of sale, the first gathering of Peas fetch from 7s. to 10s. per bushel, but this year, owing either to a large influx from other sources, or because the crop is abundant as well as simultaneous in its incoming, prices have already run as low as 4s. per bushel, much to the disappointment of the growers, who certainly looked for better returns. It must not be too readily concluded that a heavy crop, if low in price, will pay as well as a smaller one that obtains a higher figure. Whether Peas obtain 3s. or 9s. per bushel, the grower has to pay just the same for gathering, so that if the crop be a heavy one the picker finds perhaps more profit than does the grower. The charge of 6d. per bushel for gathering is almost always adhered to at any time in the season. Some growers may perhaps get their Peas gathered at a penny per bushel less, but the gain is seldom on the grower's side. A little less care in sampling, and in the handling of the haul, may soon make the penny wise into the pound foolish. Growers are very largely in the hands of their pickers, because the lapse of a few days may both spoil the crop and lose the market. Conciliation and liberal treatment is the safest and wisest policy. An expert gatherer—and women always make the best—filling ten bushels per day, of course in long hours, can show a goodly wage account at the end of the week; and sometimes it happens that whilst the husband works overtime is making 21s. per week, the wife and a couple of active girls are earning 50s. more, so that there may be worse times for the working classes than is the season of Pea gathering.

— TRADESCANTIA MULTICOLOR.—This is largely used at Ashton Court, Clifton, Bristol, as an edging plant, by Mr. AUSTEN. Planted in good soil it grows like a weed, and is a conspicuous feature in the flower garden. It appears to prefer a warm sunny position. The plants need a little pegging to get them into position, and then, if needs be, pinching-back can be performed to keep the line perfect. The old *T. zebrina* is also used for the same purpose, but *T. multicolor* more so because of its handsome and striking variegation.

— HYDRANGÆAS IN SMALL POTS.—Possibly there are many who purchase these favourite plants who are not aware how simple it is to grow them. Private gardeners generally have not the knack of cultivating them dwarf like the trade growers—such, for instance, as the Messrs. LOW, of Clapton. The cuttings after they are rooted are as a rule kept too long in heat, and the result is that plants that should be little more than a foot high are over a yard. Now is a good time to propagate these plants. Insert the cuttings into a sharp compost and place in a gentle warmth until they are rooted, and harden off immediately before much growth is made. Then turn the plants out-of-doors and plunge them in the full blaze of the sun in a bed of coal ashes. If they are kept in 4 or 5-inch pots they do not grow much, and the wood is thoroughly ripened early in the autumn. Introduce into a gentle heat the following spring and in a few weeks a fine flower-truss upon a stem not much over a foot high will be the result.

— KEW.—Wednesday, June 7, will be an important anniversary in the future history of the garden. On that day was opened the Marianne North Gallery of Paintings, to which attention is called in another column. The collection is well described as unique—no such adjunct to a botanical garden exists anywhere—and our national pride in our national garden is in so far enhanced. As to the artist, one knows not which most to admire—her talent, her undaunted perseverance, or her generosity. The value of such works and deeds is not alone estimated intrinsically—it makes itself felt

in the stimulus exerted upon others. The magnificent *Nepenthes Northiana* described and illustrated in these columns by Sir JOSEPH HOOKER, might have remained a botanical curiosity, or even less, for, till Messrs. VEITCH, fired by Miss NORTH'S drawing, sent Mr. CURTIS to Borneo, expressly to secure the plant, it was known only by the drawing in Miss NORTH'S collection. On the same day the new rock garden was opened to the public. We have so recently referred to this that we need not now speak of it again, unless it be to congratulate the authorities on the satisfactory effect they have managed to produce in a remarkably short space of time. As each year passes we hope to note still further realisations of the ideas of pictorial beauty and scientific utility with which this rock garden has been constructed.

— SPELLER'S PROLIFIC TOMATO.—When at Cliveden the other day, Mr. FLEMING called our attention to a new variety of Tomato fruiting in one of the houses, and which from the excellent character he gave it deserves to be better known. It was raised by Mr. J. SPELLER, a florist, at Woolburn, near Hedsor Towers, Bucks, about eight years ago, from the old red variety, and has been kept true since by Mr. SPELLER, who devotes six houses to its cultivation, the whole of the fruits being taken by one firm in London. It is a most prolific cropper, both under glass and out-of-doors, and the fruits grow to a good size, and of a bright reddish crimson colour all through. In outline the fruits are more corrugated than such varieties as the Stamfordian; but its freedom in bearing, beautiful colour, and fine flavour considerably outweigh that objection.

— THE WHITSUNTIDE EXHIBITION AT MANCHESTER.—The numbers present during the week this great exhibition was open at Old Trafford were 51,000, being 7000 in advance of last year. The financial result is a balance in favour of the Society of about £800.

— TREES AND SHRUBS AT CHESHUNT.—Trees and shrubs in the home nursery seem to have suffered less from the storm at the end of April than in most places, the result of which is that the bloom of shrubs of all kinds has been unusually fine and free from the seared appearance visible in many parts. Amongst Thorns the Tansy-leaved variety, *Crataegus tanacetifolia*, deserves mention for its late habit of blooming, coming in when all others are over, thus extending the season of Thorn flowers, which are favourites generally: it is a single white-blossomed variety. There is now in flower a variety of the common Laburnum that reminds us how often it happens that some really fine shrub or tree remains for a lengthened time but little known to the generality of planters—we allude to *L. Alschingeri*, a kind that should be in every garden in the kingdom. Nothing can surpass the elegance of this tree when in bloom; its flowers are a paler, more refined shade of yellow than the common variety. They are produced freely, the racemes being of extraordinary length; some measured on the Cheshunt plant were 18½ inches in length, not including the 2 or 3 inches of foot-stalk. Its branches are laden with these long bunches, as full apparently as the common variety, and it has the still further merit of not opening its flowers until the others are quite over. The tree seems to be a little more erect in habit. A tree often talked about than seen is here—the true weeping Purple Beech, as fine in colour as the ordinary kind, and of the most decided weeping habit. Amongst evergreens may be mentioned the erect-growing American *Arbutus-vitæ*, dense and full in habit, and nearly as erect and close as the form of *Cupressus Lawsoni* known as *erecta viridis*. This *Arbutus-vitæ* is of such vigorous growth, so full and distinct from other species and varieties, as to give it a character of its own.

— GEUM COCCINEUM FLORE-PLENO.—Lovers of herbaceous plants desiring to make the most of bardy plants will find this *Geum* a most invaluable plant, either for cutting for rooms or for massing in the open garden. It is one of those plants for which too much cannot be said. It makes a beautiful show planted in lines and a bed of it planted *en masse* is equal to anything that can be produced by massing the best of several *Pelargoniums*. When a good stock is obtained it is best planted in the latter way if it is intended to show off the brilliancy of the plant to the best advantage. It succeeds well in any ordinary situation, and

enjoys a genial climate. In certain parts of Devonshire it grows so luxuriantly and flowers in such profusion that it might safely be employed for the embellishment of any garden where a late spring or early summer effect is desired.

— INORA PILGRIMII.—Although Mr. B. S. WILLIAMS does not this year intend to show large specimen plants, it must not be understood that he has none to show. There are many fine examples in bloom at Holloway now, and coming on to bloom, which look none the worse in the houses for a little rest; amongst them, in flower, being a noble specimen of this new *Ixora*, which measures 4 feet through, and carries over a hundred trusses of flowers.

— AZALEA MISS BUIST.—This is an American novelty, sent out last year by Mr. B. S. WILLIAMS, which is meeting with much favour. It is of the amœna type, and very free flowering, the blossoms being pure white and of great substance, of good size, and a model of a flower in form.

— PERENNIAL SPECIES OF IBERIS.—A short time since Messrs. DICKSONS & Co., of Edinburgh, sent us a series of specimens of *Iberis* grown by them, and which we have since compared with the account given by Mr. BAKER in these columns, 1868, p. 712, as well as with specimens growing in our own garden:—

I. Tenoreana.—Of the series before us, sent us by Messrs. DICKSONS; this is the only one in which the inflorescence is so much branched as to be truly panicled. It is abundantly distinct from all the rest. Its leaves are linear, broad at the apex, and obscurely lobed. The main flower-stalk is covered with whitish hairs, and it is noteworthy that those near the top are hooked and bent downwards, forming vicious-looking tenter-hooks, the use of which is presumably to keep off unwelcome intruders from the flowers; in any case, the hairs at the lower part of the stem present a much less formidable appearance.

I. gibraltatica we mention here merely to confirm what Mr. BAKER says as to its rarity in gardens, though probably the remark is less true than when he wrote in 1868. It is the largest and finest of the series, and its glabrous, toothed leaves and large flat inflorescence (*corymbosæ*) sufficiently distinguish it. We saw it lately at Kew in bloom.

I. corifolia (we do not guarantee the name, nor have we at the moment leisure to look up the synonymy) has also a flat-topped inflorescence or corymb, the snow-white petals overlapping and forming a charming contrast with the deep shining green of the oblong somewhat spoon-shaped leathery foliage. The main flower-stem is also more or less leafy nearly to the top. What Messrs. DICKSONS send us under this name is apparently the same as our own, but if so it is later in expanding its flowers. It is quite distinct from *I. Garrexianna*, to which Mr. BAKER refers it.

I. superba (Hort.) has linear acute, or shortly acuminate, glabrous leaves and racemose flowers. The main flower-stalk is leafless near the top. This is, we suspect, the plant most commonly grown as *I. gibraltatica* in gardens. A seedling raised by Messrs. DICKSONS is very similar.

I. sempervirens has broadly linear leaves, racemose flowers much smaller than any of the preceding but rather larger than those of *I. Garrexianna*, the upper part of the flower-stalk leafless.

I. Garrexianna is, as Mr. BAKER says, the smallest of the series. Its very narrow linear leaves are somewhat larger than the preceding and have a grassy look; the small white flowers are ranged on very slender pedicels in raceme fashion.

In endeavouring to distinguish these plants attention should be paid to the size and habit of the plants, *I. gibraltatica* being much the largest, and *I. Garrexianna* the smallest. The form, size and texture of the leaves next demand attention, noting the differences between the leaves on the barren shoots and those on the flowering stems. It should be ascertained whether the leaves are broadest near the tip, in which case the prefix "ob" is applied in botanical descriptions. The comparatively flat or dome-topped inflorescence of the "corymbosæ" set is generally well contrasted with the more cylindrical form of the racemose section, but it must be remembered that the forms run one into the other, and that it is imperative to compare different specimens in as nearly the same stage of growth as possible, and that it is prevalent tendencies and indications rather than absolute characteristics that all must look. No botanist would be an hour without his pocket magnifying glass, and those who do not possess one would find themselves rewarded for the purchase of one by an inspection of

the ultimate flower-stalks or pedicels, the upper surface of which is studded over with little pimples, like so many tiny glass beads, which also run down the main peduncle in longitudinal lines, but which do not occur on the lower surface of the pedicel. Similar but smaller pearly excrescences fringe the margins of the leaves in all the species. What the use of these decorations may be is matter for enquiry.

— DWARF POINSETTIAS.—There are few plants cultivated for winter decoration that are more popular with the masses, or that better repay the cultivator for his labour, than the Poinsettia. Good heads—or, in technical phraseology, large bracts—are obtained in a variety of ways. Very often they are produced upon plants which are not conspicuous for fine foliage, and even these are useful for the embellishment of staircases where the naked stems are hidden from view. As table or room plants no brighter subjects can be used, but they must be clothed in clean green healthy foliage down to the rim of the pot. The simplest way of securing this is by late propagation. At one time it used to be the practice to start plants early in the year—say about the middle of April—and to propagate a second time in August. The tops were simply cut off about 6 or 9 inches in length, and inserted singly in small pots plunged in a brisk bottom-heat, and kept shaded from every blink of sun until the plants were well rooted. In this way good heads were obtained, but it must be admitted that, if the cuttings received the slightest check during the rooting process, the result was not always satisfactory. A much better plan is to keep a number of old stools at rest until late in the season, and then turn them out-of-doors in time to get stiff, strong cuttings by July. The cuttings should be taken off with a heel; and, owing to their vigorous nature and hardy condition, they are less susceptible to check during the rooting process, and if grown on quietly (that is to say, in a very moderate heat) during the autumn, not one plant in twenty will lose a leaf. From 400 to 500 plants have been grown in one season upon this plan for decorative purposes, and, in addition to playing a prominent part in the houses during the winter months, they also assisted materially in keeping up a good display in several plant-houses.

— THE CORONA OR CUP OF THE NARCISSUS.—What pages on pages have been written about this. The fact is, it is a botanist's business to ask questions. When he sees a plant it is his business to interrogate it as best he can, so when he finds a flower presenting any peculiarity of structure like the cup of a Narcissus, it is his business, his duty, and his pleasure to ask what it is, how came it there, what it means, and what is its use? The answers he gets to his questions depend very much indeed on the way the question is put—on the proper framing of the question, that is. In the case of the Narcissus cup the answer to the question "What is it?" has been sought in various directions, as by comparing the cup with similar conformations in other genera, such as *Paneratium*, or by observing the changes it sometimes exhibits when inclined to be "sportive." *In vino veritas*, so when a plant deviates from orthodoxy it very often lets out secrets not discernible at other times. Another mode has been by examining the mode of growth from the very earliest to the adult condition. Professor BABINGTON has kindly sent us a flower of *N. poeticus* in which to outward appearance either one or two stamens have assumed the guise of the cup, or a portion of the cup has taken on itself the appearance of a stamen. Some years ago, fascinated by the surpassing interest there is in attempting to unravel puzzles and to reduce the complex to the simple, the present writer, following in the track of others far wiser than he, ventured the opinion that the cup of the Narcissus consisted of a series of modified stamens, or, as some critic or mischievous printer wrote, of "mystified" stamens. There were grounds for this belief—there still are—Professor BABINGTON's flower might at first sight be cited in evidence along with others already recorded—but a more careful examination of the flower in question shows that in this particular instance it is not the corona reverting to a staminal appearance, but a dislocated and distorted stamen which is partially grown in union with the corona, and so looks as if it were a portion of the corona itself. The conclusions at which we arrived years ago were assailed by no less a person than Mr. WORTHINGTON SMITH. On looking again at his arguments, after the lapse of years, it

seems to us now that while in matters of detail Mr. SMITH was quite wrong, in matters of general principle he was quite right—in his interpretation of the mode of formation of the cup of Narcissus. The ill-advised use of the word "stipule," and the false analogies thereupon based, concealed the underlying truth, that the organ in question was and is an outgrowth from the flower-tube, and not necessarily either perianth-segment or stamen. In those days we relied upon one or two modes or styles of questioning when others were available, which would have shown, as they have done since, that the real interpretation of the corona of Narcissus is that it is an outgrowth from the perianth-tube—an adaptation probably to facilitate the cross-fertilisation by insect agency. The cases formerly relied on to prove the staminal nature of the corona are capable of other interpretation, which it would be tedious to give here.

— LINNEAN SOCIETY.—At the last meeting of the session, to be held on June 15, the papers to be read are:—1. "Apocynaceae Caoutchouc-Yielding Plants of Malaya and Central Africa;" by W. T. THISELTON DYER. 2. "On the Fungi of Queensland, Australia;" by Messrs. BERKELEY and BROOME. 3. "Discovery of Tasmanian Plants in South Australia;" by J. G. OTTO PEPPER. 4. "On a Collection of Ferns from the Solomon Islands;" by J. G. BAKER.

— STATICE FLORIBUNDA AND HYDRANGEA JAPONICA TRICOLOR.—These plants were exhibited at the meeting of the Floral Committee on May 23 by Messrs. CHARLES LEE & SON, and both obtained First-class Certificates. In our report of the meeting the credit of showing the *Hydrangea* was inadvertently given to Messrs. VEITCH & SONS.

— THE PROSPECTS OF THE SEED CROPS.—At this season of the year seed growers take a general survey of the seed crops, in order to read what promise there is of good or indifferent crops. As far as garden seeds are concerned, the crops generally, with the exception of Cabbages, promise well. From some cause or the other, Cabbages that in October and November last looked very promising indeed, and continued to do so through the winter, have not bolted to seed with their usual freedom, and this cause is not quite explainable. Their hearts turned hard, and remained so. The seed harvest of Cabbage will, therefore, be small. So far Peas are looking very well, and the rain has come in good time to help the plants materially, and the same may be said of Longpod and Broad Beans. Scarlet Runners and dwarf French Beans are only just coming through the ground; but with the rain has come the promise of a good plant. Broccolis look well, and in so far as Cauliflowers are grown for seed in this country—never very extensively—the crops promise favourably also. Among agricultural seeds Mangel Wurzel is looking very well. On the other hand Swede Turnips look poor, and very much "cankered" on the leaves; this, it is supposed, is caused in part by wet, but in a large measure from growing the seed on the same land for a few years. Scotch Turnips look remarkably well, and if favourable weather holds a good yield will result. White Turnips are of a very short breadth indeed this season, but they also look remarkably well. For a few years past white Turnips have been largely grown, until there was quite a glut of seed in the market; and in order that much of this accumulation might be cleared away smaller breadths of white Turnips were sown last year than is usual. On the whole, the outlook into the seed crops is not an unfavourable one, and if these "kindly fruits of the earth" can be ripened and harvested in good condition, grower and purchaser alike will have reason for congratulation.

— GHEAT AZALEAS AT COOMBE WOOD.—These beautiful hardy shrubs, although not attaining the size or possessing colours such as to rivet the eye at a distance in the way of the banks of Rhododendrons at Coombe Wood do, are nevertheless only second in importance, and are deserving of being grown much more extensively than they are in most gardens. The marked advance that has taken place in recent times in the colours and form of the flowers places the newer varieties far in advance of the old better-known sorts. In the very complete collection at Coombe Wood the following are a few of the best, alike conspicuous for their free vigorous habit, fine flowers, and distinct handsome colours:—*Coccinea speciosa*,

orange-scarlet; *Belle Merveille*, deep orange, tinged with red; *Perle du Printemps*, salmon, shaded with pink—an enormous flower; *Admiral De Ryuter*, reddish-scarlet—large and distinct; *Marie Verschaffelt*, pink, upper petals yellow; *Marie Dorothee*, white, suffused with pink and yellow; *Directeur Charles Baumann*, vermilion; *Fama*, salmon, upper segment yellow; *Nancy Waterer*, golden-yellow, shaded with salmon; *Graf von Méran*, white, shaded with blush—flowers semi-double; *Oscar I.*, creamy-white, suffused with pink; *Julius Cæsar*, red upper segment, suffused with deep orange—a telling kind; *Invictissima*, yellow, striped with pink; *Narcissiflora*, pale yellow—distinct. One and all of these may be relied on as fine double kinds.

— PAPAVER ORIENTALE.—Those who are fond of size and colour in flowers will find this a striking plant for the herbaceous garden. Good sized plants, bearing from four to six of its large scarlet flowers, are intensely bright objects—so bright, indeed, that they are hardly equalled among hardy flowers. They grow from 2 to 3 feet high, and instead of being planted, as they often are, in lines, they would probably be most effective among low evergreen or flowering shrubs, and not planted too thickly. The colour is so strong, that a few plants will be found sufficient for a small place unless it is deemed desirable to obtain a larger number for some special reason.

— PUBLICATIONS RECEIVED.—*The Great Northern Railway Panoramic Guide.* (BEMROSE & SON.)—*The Agricultural Depression, and How to Meet it.* By A. J. BURROWS, Pluckley, Kent. (RIDER & SON.)—*Lehrbuch der Baumkrankheiten.* Von ROBERT HARTIG. (Diseases of Trees.)

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 5, issued by the Meteorological Office, London:—The weather during the first part of this period was fine and bright, but the last few days were very unsettled and rainy, while in many places sharp thunderstorms were experienced. The temperature has been slightly below the mean in "England, S.W.," but in all other parts of the kingdom it was equal to, or a little above, the normal value. The maxima, which were registered on different days in various districts, were as high as 72° at Nairn, Loughborough, and Silloth, and between 69° and 71° at many other stations; while the minimum ranged from 37° at Londonderry, and 39° over central and northern England and the east of Scotland to 44° in the south of Ireland. Rainfall has been slightly less than the mean in "England, E.," "Scotland, W.," and "Ireland, N.," but considerably in excess over the western and central parts of England, and a little in excess elsewhere. Bright sunshine again shows decrease in duration, although the percentages were nowhere very low, ranging from 51 in "Scotland, E.," and 50 in "England, E.," to 34 in "England, S.," and 33 in the "Midland Counties." Depressions observed:—At the commencement of the period a large anticyclone existed over the greater part of our islands, with very light winds, varying in direction between north-west and north-east. This area of high pressure, after moving northwards with increasing easterly winds in the south, finally travelled eastwards and south-eastwards, and disappeared over Denmark and North Germany. Between the 3d and 5th numerous small depressions passed over England in a westerly direction, while on the 4th a rather important disturbance travelled over our north-western coasts from the Atlantic, causing moderate and fresh south-westerly winds in all places.

— GARDENING APPOINTMENTS.—Mr. F. CLARKE, late Gardener to T. BEVINGTON, Esq., Beckenham, and formerly of Barleythorpe, is engaged to succeed Mr. SHAND, as Gardener to the Earl of LONSDALE, Louthwaite Castle, Westmoreland.—Mr. WILLIAM DUMBLE, late Foreman at Rangemore Gardens, Burton-on-Trent, has been engaged as Gardener to C. CORRETT, Esq., Adley Hall, Salop; and Mr. JOHN RUDOLPH, another Foreman at Rangemore, has been appointed Superintendent of the Burton-on-Trent Cemetery and Recreation Grounds.—JOHN DUNSE, lately Gardener at Buratnooch House, Rannoch, Perthshire, has been appointed (through Messrs. DOWNE & LAIRD, Edinburgh) Head Gardener to Mrs. HUNT, Kibworth Hall, Kibworth, Leicestershire.

A GARDEN IN LANCASHIRE.

Is the wealthy and beautiful suburb of Liverpool named Aigluith there are many good gardens, but none more remarkable in many respects than the garden of Enoch Harvey, Esq., of Riversdale, beautifully situated on the eastern bank of the Mersey, which here assumes the appearance rather of a large inland lake than of a river. A splendid view of the grand expanse of water and the fine coast of Cheshire beyond, studded with villas nesting among the woodlands and pastures, is obtained from every part of the place. The charming landscape is rendered still more picturesque by the bold background formed by the rounded forms of the Cheshire hills, blending with and toning down those of the more rugged and distant Flintshire mountains. The place is small, but an excellent example of what may be made of a small garden in the hands of an amateur, whose views of gardening, both in its practical, scientific, and æsthetic relations are original and untrammelled by the dicta of any particular school.

Mr. Harvey's views of gardening have nothing conventional in them. In developing his garden he has not been led by them into the laying down of artistic lines and other merely mechanical features of surface, to the exclusion of the more important consideration of what was fittest and best for the classes of plants he delights to cultivate. His love of plants is catholic, and his aim in laying out his garden has been to gratify that love to the utmost, by providing suitable accommodation for the beautiful things of all climates and elevations. In doing so it has—owing to the physical peculiarities of the situation—been necessary to give more heed to the consideration of how the wind blows than merely artistic effects. The place is in the teeth of the blast which frequently sweeps from the north and north-west; therefore, a bold belt of hardy trees has been planted on the northern and western sides of the garden. In the bend so formed the rockwork, bog-beds and Lily-beds, which are nestled pretty closely together, find cosy shelter. The place is further adorned with clumps of *Rhododendrons*, *Azaleas*, and other choice evergreen and deciduous and flowering trees and shrubs. Fine specimen *Hollies*, *Thorns*, &c., are dotted about the lawn with easy, graceful taste, so as to help rather than prevent the enjoyment of the charming landscape stretched to the right and left to the westward. The margin of each clump of shrubs is made the home of choice hardy perennials and annuals, of which there are hundreds of species and varieties.

Nor are bedding-out plants despised or neglected. I have said Mr. Harvey's love of plants is catholic; his interest in them is neither led nor influenced by fashion. Whilst his devotion is, perhaps, most freely given to his alpine gems and his Orchids, he can appreciate the brilliancy of the spring and summer bedding, for which limited accommodation has been provided in a sheltered corner of the lawn.

The principal feature of the garden is the rockwork. It is constructed in the most simple and natural manner, consisting of depressed hollows and bold elevations, commanding every aspect and circumstance of habitat. Fantastic notions, which too often mar the beauty and usefulness of works of this sort, are entirely absent. Yet there are pleasing lines and contours combined with a proper adaptation of the structure to the culture of a large and varied collection of alpine plants.

Viewed from a distance, the most prominent objects on the rockwork at the present time are bold masses of the following, many of them several feet across:—*Saponaria ocyroides* and *S. o. splendens*, the latter a variety, we believe, sent out by Messrs. Backhouse, of York, and a great improvement on the better known normal form; *Lithospermum prostratum*, *Anemone sylvestris*, *A. alpina*, *Veronica pectinata* rosea, *Hormium pyrenaicum*, *Saxifraga hybrida*, *S. recta*, *S. atropurpurea*, *Cheiranthus alpinus*, *Erodium petraeum*, *Genista triquetra*, *Phlox atropurpurea*, *Daphne encaurum*. These, in the boldness and breadth of the masses they exhibit, give colour to and light up the whole picture, and neutral and relieving tints are supplied by the varied tints of green and grey of intermixed masses of *Saxifraga*, *Cerastium*, *Thymus*, while here and there a bold block of red sandstone, rearing its head to give shade and shelter to some gem or genus at its base, also adds a touch to the charming blending of colour that pervades the whole.

A closer inspection of the rockwork reveals many

beautiful and rare things in and out of flower and yet to come. We shall only note those which we observed in flower on the occasion of our visit. Fine clumps of *Dianthus alpinus*, *Arenaria purpurascens*, *Astragalus adsurgens*, a gem alike in style and colouring; and the scarcely less beautiful but more common *A. monspessulanus*, *Erius alpinus*, *Geum montanum*, *Delphinium nudicaule*, *Cypripedium calceolus*, *Trollius Fortunii* pl., *Campanula Elatine*, *Dodecatheon integrifolium*, *Ranunculus parassifolius*, *Rosa pyrenaica*, *Rubus deliciosus*, *Ranunculus acrifolius*, the single-flowered form, very beautiful and much more rare than the double *Fair Maids* of France; *Phyteuma orbiculare*, *Ranunculus repens* fl.-pl., and many other bright things too numerous to mention at present. Two grand plants of *Rosa rugosa*, one white, the other rose, occupy a prominent position on the rockwork, and showed, by their uncathed and luxuriant condition, that they have withstood the destructive blasts of spring, which had crippled the H.P. Roses to be found plentifully in other not less sheltered spots in the garden.

One is tempted to dilate further on the many points of interest that still remain unnoticed in the outdoor department of this interesting garden, but space will only admit of a brief notice of the collection of Orchids, which Mr. Harvey is getting together with as much intelligence and success as guided and attended his efforts in making up his alpine collection. It is only about three years since Mr. Harvey set himself earnestly to Orchid culture, but in that short time he has done a great deal. No doubt the secret of his success lies in the fact that he is his own gardener. He directs and superintends everything in connection with cultural matters, and does much with his own hands. The collection, although containing few large or specimen plants, as might be expected in one so recently formed, yet bears the marks of skillful culture. The plants are generally in good health—*Odontoglossum* are particularly so. The following were much admired by Mr. Harvey's friends on the dinner-table on a recent occasion—*Cattleya Mendelii*, *C. Mossie*, *Odontoglossum citrosum*, *O. crispum*, *Oncidium oncolor*, *Lælia cinnabarina*, and *Oncidium flexuosum*. They were arranged along with Maidenhair Ferns, in a large oblong dish of Chinese *cloisonné* (part of the loot of the Summer Palace at Peking), pale blue picked out in gold and dark crimson flowers, the whole forming a charming centre-piece of a rare description. *S. G. W.*

LIST OF GARDEN ORCHIDS.

DENDROBIUM.—(Continued from p. 735.)

223. *D. STIPITUM*, Lindl., *Bot. Reg.* 1838, Misc., n. 94; *Walt. Ann.*, vi., p. 260.—India. Cultivated by the Duke of Devonshire and Messrs. Loddiges. Resembling *D. candidum*, but having smaller flowers; the labellum furnished with a deep orange callus below its point, and the ovary is thickly covered with a coarse tow-like hairiness. Hort. Kew.
224. *D. SUBVANSIUM*, Rehb. f., *Gard. Chron.*, n.s. i., p. 490; *Walt. Ann.*, vi., p. 256; *Walt. Bot. Mag.*, Feb. 23, 1878.—Barma. Introduced by Mr. Buxall for Messrs. Low & Co., a handsome species, closely allied to *D. chrysotomum*, having darker blotches on the labellum. Hort. Kew.
225. *D. SUBARISTULUM*, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv., reprint, p. 12.—Java. Buitenzorg Botanic Garden, 1862. Flowers small, green and white.
226. *D. SUBULATUM*, Lindl., *Gen. and Sp. Orch.*, p. 61. *Onychium subulatum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 288.—Java. Buitenzorg Garden.
227. *D. STACHYDIUM* SUBULATUM, Lindl., *Bot. Reg.* 1838, t. 65.—India. Introduced by Miss J. Gibson for the Duke of Devonshire, in whose garden at Chatsworth it flowered in 1838. "A fine species, nearly related to *D. Grinithianum*, from which it differs in its three-lobed peduncles, and in the form of the lip." *Stem*, disc-shaped, deeply furrowed. Flowers tawny-yellow, pencilled with red on the dilated labellum.
228. *D. (DENDROBYNNE) SUPERBIENS*, Rehb. f., *Gard. Chron.*, n.s. vi., p. 516; ix., pp. 49, 49; with a figure, 659; *Floral Mag.*, n.s. t. 204. *D. Goldiei*, Rehb. f., *Gard. Chron.*, n.s. ix., p. 622; *the Garden*, Sept. 14, 1878.—North Australia. Imported by Messrs. Veitch. Allied to *D. bigibulum*. Handsome large dark purple flowers. I have referred to *D. Goldiei* here because I think it can only be regarded as a fine variety of the same species. Dr. Reichenbach required considerable persuasion to accord it the status of a species. It sometimes bears several many-flowered racemes on the same stem, and, as Dr. Reichenbach observes, it is the finest *Dendrobium* from the Australian region. Hort. Kew.
229. *D. (EULOBODIUM) SUBERBUM*, Rehb. f., *Walt. Ann.*, vi., p. 252. *D. macrophyllum*, Lindl., *Bot. Reg.* 1836, Misc., n. 46; *Fl. des Serres*, t. 757, non Richard. *D. macranthum*, Hook. *Bot. Mag.*, t. 2970, non Richard.—Manilla. Introduced by

Messrs. Loddiges. There are several varieties of this handsome species. This, the type, had flowers 9 inches in circumference; the sepals and petals of bright rose colour, with a downy lip, deeply stained with two large blood-red blotches. Hort. Kew.

Var. ANOSMUM, Rehb. f., *loc. cit.*, p. 283; Lindl., *Bot. Reg.* 1845, Misc., n. 41; *Pant. Mag. Bot.*, xv., p. 67, with a coloured plate (species)—Philippine Islands. Introduced by Loddiges, with whom it flowered in 1847. Flowers smaller, lilac, with a deeper coloured base of lip. Hort. Kew.

Var. GIGANTUM, Rehb. f., *loc. cit.*, p. 283. *D. macrophyllum*, var. *gigantum*, Lindl., *Gard. Chron.* 1882, p. 21. Flowers four times as large as the ordinary form.

Var. PURPUREO-MAGNIFICUM, Rehb. f., *loc. cit.*, p. 283. *D. macrophyllum*, var. *purpureo-magnificum*, Lindl., *Fl. van der Hoff*, p. 17.

230. *D. TAURINUM*, Lindl., *Bot. Reg.* 1842, n. 28; *Pant. Mag. Bot.*, x., p. 247, with a coloured figure; *Flora des Serres*, t. 1094.—Manilla. Sent by Mr. Cumming to Messrs. Loddiges, with whom it flowered in 1843. A very distinct species, having large flowers in racemes terminated by a long, slender stem. Sepals yellowish-green, rolled back at the points; petals very long, deep purple, twisted; lip paler purple, striped.

231. *D. TETRAELMUM*, Lindl., *Gen. and Sp. Orch.*, p. 91; *Miq. Nederl. Ind.*, iii., p. 534. *Onychium tetraelum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 327.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous.

232. *D. TERES*, Lindl., *Bot. Reg.* 1840, Misc., n. iii.; *Walt. Ann.*, vi., p. 281.—Singapore. Imported and flowered by Messrs. Loddiges. Leaves terete, flowers in terminal naked racemes, small, whitish, fragrant; lip stained with orange near the apex.

233. *D. (STRONGYLE) TERETIFOLIUM*, R. Brown, *Prodr. Fl. N. Holl.*, p. 333; *Benth. Fl. Austral.*, vi., p. 475; *Endlicher, Iconogr.*, t. 69; *Bot. Mag.*, t. 2814. *D. concolor*, Rehb. f., *loc. cit.*, 1841, Misc., n. 9.—North-east Australia. Introduced by Mr. Moore, of the Sydney Botanic Garden, and flowered at Kew in 1853. A very distinct and curious species, having slender stems, very long, terete racemes, and small white flowers in panicles. Sepals and petals very narrow; labellum strongly undulated.

234. *D. TETRACHROMUM*, Lindl., *Gen. and Sp. Orch.*, n.s., xiii., p. 712.—Borneo. Imported by Messrs. Veitch through Mr. Curtis. Flowers white, with some yellow, green, and purple. Allied to *D. aqueum*.

235. *D. TETRAEDE*, Lindl., *Gen. and Sp. Orch.*, p. 87. *Onychium tetraede*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 327.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous.

236. *D. TETRAGONUM*, A. Cunn., *Bot. Reg.* 1837, Misc., n. 33; *Benth. Fl. Austral.*, vi., p. 279; *Bo. Mag.*, t. 593; *Gard. Chron.* 1873, p. 363.—North-east Australia. Cultivated by Messrs. Robinson in 1874. A curious species with tetragonal stems thickened upwards from a very slender base and proceeding from spheroidal pseudobulbs. Flowers similar in form to those of *D. amboinense*, but smaller and of a yellowish-green with a yellow red-striped labellum. Hort. Kew.

237. *D. THYRSODEUM* = *D. densiflorum* var. *albocinctum*.

237. *D. THYRSODE*, Rehb. f., *Hamb. Gartenz.*, xv., p. 51. *D. Kuhnii*, Lindl., *Bot. Reg.* 1847, t. 47; *Gard. Chron.* 1847, p. 655; non *Fendulum*, Kuhnii, Blume, *Reichenbach, Bot. Mag.* Introduced by Mr. T. Lobb for Messrs. Veitch. Allied to *D. secundum*. Flowers bright rose.

238. *D. (DENDROBYNNE) TUPILIFLORUM*, Rehb. f., *Gard. Chron.*, n.s. viii., p. 72.—Fiji Islands. Discovered and introduced by Mr. Peter Veitch. A miniature, curious species with small, spider-like, purplish flowers, whose sepals and petals terminate in long bristles; labellum fringed.

239. *D. TOKAI*, Rehb. f., *Hamb. Gartenz.*, xxi., p. 293; *Seeemann, Flora Tonicis*, p. 304, t. 92. *Fiji Islands*. Discovered by Mr. T. Lobb for Messrs. Veitch. Flowers large, white, suffused with purplish-rose; labellum yellowish-white; petals waxy. Allied to *D. Pierardii*, Hort. Kew.

240. *D. (EULOBODIUM) TOETILE*, Lindl., *Gard. Chron.* 1847, p. 797, with a figure; *Bo. Mag.*, t. 4477. Mouthed. Introduced by Mr. T. Lobb for Messrs. Veitch. Flowers large, white, suffused with purplish-rose; labellum yellowish-white; petals waxy. Allied to *D. Pierardii*, Hort. Kew.

241. *D. (EULOBODIUM) TRANSPARENS*, Wallich; Lindl., *Gen. and Sp. Orch.*, p. 79; Lindl. and *Pant. Fl. Gard.*, t. 1, p. 27; *Bot. Mag.*, t. 4663; *Leafield, Gard. Fleur.*, t. 68; *Walt. Ann.*, vi., p. 285. *D. Henshallii*, Rehb. f., *Bongibandi*, iii., p. 226.—Assam, &c., India. Originally introduced by Mr. Thomas Lobb for Messrs. Veitch about 1852. A pretty species allied to *Pierardii*, but less brilliantly coloured. Flowers profuse, transparent white, tinged with purplish-rose towards the tips; labellum with a small deep purple disc encircled by a yellow zone, and bordered with purplish-rose. The figure in the *Garden Fleurist* represents the sepals and petals almost stone-grey, with a white zone to the labellum. Hort. Kew.

D. TRIMMUM = *D. mutabile*.

(To be continued)

HOME CORRESPONDENCE.

Epping Forest in Ancient British Times.—In the interesting account of Epping Forest at 75, the writer briefly refers to the condition of the Forest in the time of Cæsar. Some of the camps in the Forest are well known, and the Ambresbury Earthworks have recently been admirably described and illustrated by Major-General A. Pitt-Rivers in the *Transactions* of the Epping Forest Club. It is, however, not generally known that flint-flakes, as struck off from flint blocks by the Ancient Britons, are by no means infrequent in the Forest. British pottery, generally in a fragmentary condition, is sometimes found in the newly disturbed ground. I have many times found both. Three superb wholly polished flint celts were found last February in an old western outlier of the forest by a workman in digging a shallow drain not far from Leyton: the celts were as sharp and perfect as on the day they were made, and had evidently never been used. They were only a few inches below the surface, and were resting side by side. The man saw all three in his shovel at once. These three instruments must have been laid down side by side by their owner in prehistoric times, and never gathered up again, and so they gradually got buried by the dust. The man who found the celts was one of a company with whom I often fraternise (I fraternise with all the excavators round the district where I live), and so a few hours after the celts were found, I availed myself of the opportunity of easily acquiring them. Some persons might say these celts ought to have been deeper in the grounds if the earthworks ever since the Roman Conquest had been piling fresh earth upon them, but such persons often forget that there is a considerable amount of denudation going on from rain in sloping places. Waltham is also mentioned in your account. There is preserved in the schoolroom at Waltham Abbey a fine example of a stone hammer made from a large flatish quartzite pebble; this instrument was found in the Lea, close by, and is almost unknown to archaeologists. The surface geology of Epping Forest is very interesting, especially where the gravels and sands occur. Some are glacial, as at Buckhurst Hill, whilst others belonging to the Lea and Roding are of river origin, and contain the rude flint implements of primeval man. Sir Antonio Brady was surprised when I showed him my palæolithic implements from the valley of the Roding, close to where he had for so many years disinterred the mammoths at and near Hford. Sir Antonio had never suspected the presence of the relics of man with the bones of his great fossil beasts, and the sight of the stones was a revelation to him. The presence of these stones, found by me in the Roding valley, at Hford, East Ham and Barking, has not hitherto been published. *W. G. Smith.*

Wasps.—The past mild winter has evidently been favourable for wasps, as for weeks they have been on the wing in great numbers, and up to the end of May we have paid for over eighty dozens; but although this quantity has been destroyed, we see many daily about the trees and bushes and in the houses, and on the first of June, I had a nest brought me from a heap of loam, and the man who found it assured me he killed two wasps at it, which he showed me. I had always thought that all wasps living through the winter were impregnated queens, and that each one that survived made a nest, and was able to breed young ones, which power I should much like to deprive them of, for assuredly they are the greatest plagues one has in a garden, for no sooner is fruit ripe than they are at it, spoiling and devouring it in the most wholesale and deplorable manner. I judge by the numbers taken up to make nests, things will be entirely eaten up by them this season, and it would be well if some one could make up a mixture to poison the lot, for to keep them at bay by means of protectors is out of the question. Hawthorn's hexagon netting may be so used as to exclude them from vines, but Peaches and Apricots on open walls are quite at their mercy. If we are to save these by-and-by unusual measures will have to be adopted, and I shall be glad to hear if any one has tried arsenic and sugar syrup, and with what result. If set up in shallow saucers or plates on the tops of walls there would be no danger in using the arsenic, and as it is said to be tasteless I should think the wasps would take it readily, and, if so, they would seal their own doom. An easy way of destroying their nests, if in the ground, is to pour tar into the holes and bung them up tight, or turps used in the same way, but better still, as being more economical, is to soak rags or wadding in it and plug the hole up with that. The time to assault the wasps is at night, when they are all home, and if the places where the nests are are marked during the day there is no difficulty in finding them out. The men here often dig them out after having squibbed them with a mixture of powder and sulphur put into Bamboo or Elder tubes, the smoke and fumes from which so stupefies them that they lie as if dead for a time, and

while in that state they may be smashed up with the comb, mixed with the soil, and a quick end of them made. *F. S.*

Stott's Monarch Rhubarb.—This grand variety was well shown here to-day by Mr. Elliott, gardener to James Moffat, Esq., Edenhall, Kelso. Seven stalks averaged 6½ lb. weight each, and measured 24 inches by 9 inches in diameter. A clump of this gigantic-leaved Rhubarb would make a splendid ornamental plant: the leaves measure about 4 feet in breadth by 3 feet in length. The flavour of the Rhubarb stewed is considered about equal to green Gooseberries stewed. *Stuart & Mein, Kelso, N.B., June 6.*

Double White Lapageria.—It seems a little curious that of two plants of Lapageria, one of L. alba and one of L. rosea, planted close together at the north end of a small span-roofed greenhouse here about seven years ago, each has produced within the last few months a bloom having double the usual number of segments, especially as the growths made by the plants are by no means remarkable for vigour. Besides the perfect double flower of L. alba I now send you (fig. 119), it has evidently attempted to produce something even more extraordinary, but, as you

FIG. 119.—LAPAGERIA ALBA FLORE-PIENO.

will see by the enclosed, the result is a miserable failure. [Not quite so; straws show which way the wind blows, though they themselves are not very valuable. *Ed.] G. Duffield, Winchmore Hill.*

Mr. Darwin's Letters.—Will you allow me to mention that I am collecting my father's letters, with a view to a biography. I shall be much obliged to any of my father's friends and correspondents who may have letters from him, if they will kindly allow me to see and make copies of them. I need hardly add that no letter shall be made public without the full consent of its owner. *Francis Darwin, Down, Beckenham.*

Carter's Model Cucumber.—We observe in your report of the Reading show that the special prize for the best brace of Cucumbers was awarded to our Model, and which is stated to be a selection from Telegraph. Be good enough to allow us to say that Carter's Model Cucumber was not a selection from Telegraph. *James Carter & Co.*

Best of All Melon.—Without entering at all into the controversy that has been carried on—on rather too personal lines—in your columns concerning the merits of this Melon, perhaps you will permit me to say that having been called upon at the great show at Manchester on May 29 to express a judicial opinion

on its merits, the samples shown by the raisers were of excellent quality and far superior to another new oval-shaped Melon that competed against it. But there happened to be present in competition a single new scarlet-fleshed Melon called Shelton Abbey Scarlet-flesh, of most exquisite flavour, that carried off the only prize given for the best new Melon. Had there been a second prize Best of All would have taken it. In regard to the scarlet-flesh certified I could not distinguish between it and our strain of Queen Emma—a green-fleshed favourite that we have grown for many years that has now changed into a scarlet, and the scarlet strain of which took first honours at Manchester some two years ago. Queen Emma seems to have lost none of its exquisite flavour with the change of colour in its flesh, and still holds its own as one of the best Melons in cultivation. Has any one the green-fleshed strain true? If so I shall be glad to exchange scarlet with them, as I wish to have it back. I may add that I have had Best of All very good flavoured. It was rather too small for us, and therefore we have not grown it in quantity. I agree with the raisers that in Melons much depends on culture, and also a great deal on the taste of growers and jurors; and hence the likes or dislikes of cultivators afford no very reliable data for determining the merits of particular varieties. Again, Melons for sale won't sell unless they are large, prettily netted, or finished externally, no matter what their natural merits may be. *D. T. Fish.*

Sutton's Late Queen Broccoli.—Mr. Muir has brought an invaluable vegetable to the front in Sutton's Late Queen Broccoli. Here it has been very largely planted again this season, and thoroughly tested in two grand breadths in these gardens, where I have cut as many as twenty dozen per week, and for many weeks in succession. It must eventually be the Broccoli of the day, but unless it is grown no one can form any idea of its intrinsic value to them. It is of a very dwarf compact habit, and has splendid white compact heads of a medium size, and of a most delicious flavour. All our plants came as true as possible from seed direct from Messrs. Sutton & Sons. Our last cutting was made yesterday, June 3, so that it forms a capital substitute for cauliflower, and fills up a break which otherwise would be caused. *J. Clarke, The Gardens, Eryndale.*

Hardy Rhododendrons.—How grand these are again this year, last season having just suited them, as the rain came in time to enable them to make plenty of growth, which ripened up after and set well with bud. These are now opening fast, and plants are making a gorgeous display, and will continue to do so for some weeks to come. As Rhododendrons are such excellent evergreens and so hardy, the wonder is they are not more planted instead of Laurel and other shrubs that have nothing but their leaves to recommend them, except it may be that they are of quicker growth and take less time to shut out unsightly objects from view. This need not militate against their use, for where there is room Laurels or Hollies may be planted behind; indeed it is always a good plan to do this, as they form admirable nurses and an excellent shelter against violent winds, which, unlooked, knock the heavy trusses of Rhododendron blossoms about. Laurels, being the faster growers, make a capital background and answer the purpose of shade, which, in moderation, Rhododendrons like and require. For planting in front of Rhododendrons nothing looks better than Berberis Darwinii, and with regular belts of the three shrubs named a splendid effect is produced. Borders in front may then be utilised for herbaceous plants, which when so grown look more at home than they do anywhere else. Why Rhododendrons are not more often seen in quantity in gardens is a matter about which the erroneous notion in people have that they will not succeed without peat, which is a great mistake, as in sharp, clean, gritty soil they do as well, or better, without it than with it. What they do object to is chalk or lime rubbish, which is fatal to them, as their roots will not work in it or near it. Half rotten leaves from Oak and other deciduous trees they delight in, the only danger in a free use of these for them is their liability to generate fungus, especially in dry soils, where it breeds and spreads rapidly. Here the ground requires no preparation for Rhododendrons whatever, and we simply dig a hole and plant anywhere, and they grow and flourish in the greatest perfection. In places not quite so favoured, all that is necessary is to use plenty of sharp sand, and work it into the land round about where the plants are to stand, or what is even better than sand, is road scrapings and the turfy trimmings from the sides, which Rhododendrons lay hold of at once, the soil gatherings are free from chalk or other calcareous matter, and the Rhododendrons are fond of moisture, they will not do where ground is continuously wet, unless the drainage is free. In soils naturally dry, mulching is a great help, as it affords shade to the roots, keeps them cool and moist, and prevents them suffering during hot arid weather. Long stable manure is as good as anything

to mulch with, but the mowing of lawns or any grassy litter of that kind may be used with advantage. Rhododendrons increase readily by layering their branches, which, if buried three or four inches deep, root in a couple of years. *J. S.*

Mulching by Strawberries.—The remedies against slugs advised by several correspondents the good in their way, but to have fine Strawberries the beds must be mulched, the mulching being necessary to keep the ground cool and shaded and the roots moist, which is essential for the production of large, rich-flavoured fruit, as any check to its swelling spoils its quality by making it sour. We always make a practice of strawing our beds down before the plants come into flower, as then the work may be done in half the time it takes later on, when the foliage spreads farther about and the stems are borne down by the weight of the blossoms or fruit; and not only this, but when the rain falls soaks in, and is not taken out again in the rapid way it is by evaporation when the ground is not covered. The litter we generally use is that of straw saved from the ice stack, or that which has done service for covering up cold frames, which by the time it is done with for either of these purposes is short and broken up, and therefore just the thing for mulching. By putting it on early, the litters portion of stable manure answers well, as by the time the Strawberries are ripe it is washed sweet and clean. Where slugs are troublesome, the best thing ever met with is dried Fern or Bracken, which, broken up, has sharp edges and ends that both slugs in their movements, and renders it very difficult for them to travel. To get British Queen Strawberries to colour well it is necessary to prop or sling the fruit up, the most expeditious way being to have a few sticks and run a strand of matting round each plant, keeping the matting as high from the ground as the stems will fairly admit. Wire guards are, I believe, made and sold for the same purpose, and if to be bought cheap are preferable to anything, as they may be quickly put down, and would last a lifetime. I am thinking of trying some coarse-meshed narrow rabbit wire run along over each row of plants low enough for the fruit-stems to protrude, which ought to answer and keep it up out of harm's way. *J. S.*

Notices of Books.

Holt Castle; or, the Threefold Interest in the Land. By Professor Henry Tanner, F.C.S. London: Chapman & Hall.

This latest work of the author of *Jack's Education; or, How he Learnt Farming*, has the merits of a pleasing style and a subject well chosen and well treated. In a readable and—to praise it further—a small volume of 237 pages, the management of the model estate of Holt Castle by a model agent, acting under a model landlord, is described. There are no technicalities in the book, no talk of ploughs, or barley, or chemical manures; it is not a work written only in the interest of rent-payers and rent-receivers, farm tenants and landlords, and dealing only with material interests: on the contrary, at the first rent-audit, which the Squire happily calls his "harvest home," when the new steward has taken office and begun to develop his plans, the toast of the evening is "Success to the threefold interest in the land," or, in other words, to landlord, tenant, and labourer. Then, again, instead of offering the reader a schedule of the lowest prices at which farm labourers may be induced to undertake various kinds of work, after the fashion of most books on farm improvement, various plans are laid before the reader whereby the happiness and efficiency of labourers may be increased. The ladies, too, are called to council, from the Squire's wife to the cottage dame, and the whole community pulls together and strives to comprehend its mutual wants. Of the pleasant story and the agreeable characters of this healthy book, the rapid incidents, the successful development of the plot, and the happy ending, we need not speak. The story is a cheerful one from the outset. That excellent man, Mr. Hoimes, "our agent," takes the helm, and from that hour all goes well. A fall from a horse is the worst disaster throughout the volume. One heart, and one only, is in danger of being rather broken for a while, but this cannot be reckoned as an evil, since it is a manifest delight to have the heart a little broken, but not too much so.

We have noticed the attractiveness of the book before us in the hope that a subject of such supreme importance to the whole community as the welfare and management of a landed estate may attract attention now that the opportunity offers of studying

it in the form of a novel. The *Journal* of the Royal Agricultural Society contains, perhaps, in special papers a full description of all the plans set forth by the author of *Holt Castle*, except that the influence of ladies is ignored in the *Journal*, while Professor Tanner makes it an essential part of his scheme that all the ladies of the estate, as already said, should join in promoting such methods of improvement as lie within their province.

But the *Journal* of the Royal Agricultural Society is a technical and learned volume, and does not, of course, devote itself in any single paper to a comprehensive scheme which shall enlist the sympathies of general readers. A demand, however, has arisen for a somewhat new and certainly a most wholesome kind of literature. We shall only add to this very brief notice of a work which is not quite in our department, that several subjects are handled which the difficulties of the labour question have brought into prominence in recent years.

At the conference of wives—the squire's, agent's, tenants' and labourers' wives—both cows and cockies receive their due attention. In those arable districts, as in Suffolk, where the labourers are entirely ignorant of the management of a dairy, and would hardly know at which end of a cow her lactical fountain is situate, it is useless attempting cow-keeping among farm labourers. But Holt Castle is in a pastoral district the dairy is understood, and proper arrangements are, therefore, made for calling back to usefulness that banished animal—the cottager's cow. The author of *Holt Castle* is perfectly correct, that the labour difficulty is only in abeyance, and that united efforts must be made to render rural life and farm work more attractive. The plans of "the three-fold interest" relating to the labour question seem to us, therefore, particularly interesting, and especially the arrangements for securing a more systematic teaching of young labourers by means of apprenticeship. Farmers and farm labourers between them have abandoned the domestic system of the last century, so far as the South of England is concerned, and young labourers are trained, or neglected as the case may be, in cottages, instead of spending their earliest years of youth in the farmhouse kitchen under the immediate influence of their employers. Both have been great losers by the change. Home is the best place for a child, and the worst possible school for a young man, whether he be a young farmer or a young labourer. This and other kindred subjects are well handled in *Holt Castle*. We need hardly add that the author, as a Professor of Agriculture, does not neglect any part of the comprehensive scheme of estate management to which the book before us is devoted. In the course of a very readable story the dry bones of many a tough and technical subject are clothed with life and interest.

Les Meilleurs Blés. (*The Best Varieties of Wheat.*) Paris: Vilmorin.

Messrs. Vilmorin, Andrieux & Cie. have lately issued a handsome quarto volume containing coloured illustrations and descriptions of the best varieties of Wheat, together with indications of the circumstances which influence the yield and the quality of the crop. In order to increase the crop without increasing the cost of production it is necessary among other things to exercise care in the selection of the varieties most suitable for cultivation under particular circumstances. This necessitates a knowledge of the varieties and of their qualities. Few people can have had better or more extensive opportunities of studying these matters, and few have turned them to better account than MM. Vilmorin and their predecessors. The collection of varieties accumulated during three generations of the house of Vilmorin is probably the largest and most complete in existence, and the notes that have been accumulated by them concerning the cultivated cereals during a long series of years under every variety of season, soil and climate, form probably the most complete record that exists.

All the varieties are referred to seven types, viz.:—*Triticum sativum*, *T. turgidum*, *T. durum*, *T. polanicum*, *T. Spelta*, *T. amyaleum* and *T. monococcum*. The points of distinction reside in the separation or otherwise of the glumes or chaff-scales from the grain, the hardness or softness of the grain itself, the presence or absence of awns to the spikelets, the colour and pubescence of the spikelets, and the colour of the grain. Each variety figured by Messrs. Vilmorin is accompanied by descriptive text, giving the characters, history, distribution, and special

adaptations of each variety. The value of such a publication needs no telling. Hallett's Pedigree Wheat we see is referred to Autumn Victoria, of which it is considered to be a special race produced by selection. Major Hallett himself considers it to have originated from the Nursery Wheat, but according to Mr. Vilmorin Mr. Hallett's Wheat has all the characteristics of the Victoria Wheat, and none of those of the Nursery Wheat, neither in the grain, the ear, nor in the stalk. We should have been glad to have seen some statistics, which no doubt Messrs. Vilmorin could furnish, as to the comparative yield, under equal conditions, of each variety, and of the quality as estimated by the miller. Moreover, as this work, from the valuable information it contains as to the variation of Wheat and the influence of external conditions on them is likely to be consulted as a work of reference alike by physiologists, botanists, and agriculturists, it is an unfortunate circumstance that the plates are not numbered, and that no general alphabetical index is given. These deficiencies can, however, readily be supplied in a new edition.

— We have received from the publishers of the "Holiday Handbooks," the first of the series, *A Trip to the Ardennes*. Described in Mr. Percy Lindley's sparkling style, the comparatively unknown ground (so easily accessible) will, we think, prove very attractive to those who have only time for a short holiday. This handbook is issued at the small price of 1s., is illustrated with woodcuts, contains a map of the district, time-tables, and full directions as to the best routes and hotels. We can cordially recommend this unpretending guide to those who are inclined to "try" the Ardennes, and to visit the very interesting cities and towns in the vicinity.

— *The Great Northern Railway Panoramic Guide* (London: Bemrose & Sons) will prove a useful companion to those who like to beguile a long railway journey by ascertaining something more than the name of the towns and villages they are passing through. There is a useful map, and much general information in this pamphlet.

— *Cookery and Housekeeping*. By Mrs. Henry Reeve. With coloured illustrations and numerous woodcuts. (London: Longmans, Green & Co.)—This is a book that will make its way in spite of the plethora of cookery books which exists at the present time. Most of the receipts are clearly given, the "hints" are very "sensible" and useful to the inexperienced, while the numerous bills of fare for small and large families will help and relieve many a mistress who is puzzled to know what she shall provide for dinner and for breakfast. In a new edition we venture to suggest that *gravy*, that very important item, shall not be excluded from the index, and that clearer directions shall be given to the cook on some points, respecting the operation of roasting; for instance, everybody ought to know now-a-days that a leg of mutton should be plucked for five minutes into boiling water, not into "hot" water only, which would not set the juices of the meat; while a teaspoonful of cayenne pepper (!) and one of mustard would render a cheese salad neither an agreeable nor a safe dish. A little more careful revision would render this book a very valuable one.

— *How to Live on Nothing*. By Madame Bouchard (Mrs. Arthur Smith). (Chapman & Hall, Henrietta Street.)—A little *brochure* published at the small price of 6d., and containing many useful recipes. It is rather disappointing, however, on opening the book, to find that it does not tell us how to live upon nothing—a secret which a good many people now-a-days would like to discover—or even how to exist upon a straw day, which would be the next best thing perhaps, but it does tell us how to cook Orel, to make a Dandelion salad, to render cold Parsnips edible, in short, how to make a little go a long way, and to utilise a small kitchen garden to the best advantage. The author says: "If you live in the country, your garden should supply you with most of your food. I myself can go at any time into my garden and get my dinner." A very useful cooking-stove is described also, obtainable in Paris at a small cost. One main reason why French cookery is so superior to English, is that the stoves are so much pleasanter to use, more capable and economical than the clumsy, costly, extravagant articles found in most English kitchens.

— *The Botanical Atlas.*—Under this title Mr. D. McAlpine is preparing a series of illustrations destined to serve as a guide to the practical study of plants. The illustrations (coloured) in the part before us comprise a series of dissections of common wild flowers with appropriate descriptive matter. The figures are just such as a student should draw for himself. In plate 15 the placentation in the diagram of the flower is not well represented, and the statement, "free central placenta," as applied to Caryophyllaceae, demands some explanation. The foliage leaves of *Fumitory* and *Geranium* are not rightly described as compound. In a publication designed for the use of beginners strict accuracy is specially desirable. The *Atlas* may be useful in schools, with the assistance of competent teachers. Messrs. W. & A. K. Johnston are the publishers.

— *The Orchid Album.*—The species figured in the two last parts of this important publication are *Angreæum cburneum*, *Dendrobium superbum* var. *macrophyllum*, *Odontoglossum crispum* var. *flavolum*, *Lælia anceps Dawsoni*, *Cypripedium chloroneurum*, *Dendrobium bigibbum*, *Phalenopsis Stuartiana* var. *nobilis*, and *Odontoglossum Krameri*. We shall notice these more fully on another occasion.

— *The Florist* for June contains coloured figures of the Dryden Nectarine and the splendid Apple called *Beauty of Hants*.

— *The Illustration Horticole.*—Recent numbers contain figures of *Croton magnificus*, *Heliconia triumphans*, *Araucaria Muelleri*, *Spathiphyllum hybridum* x, *Kenta Luciani*.

— *Gartenflora.*—The May number contains coloured figures of *Sedum rhodiola* var. *limifolia*, *Dracocephalum imberbe*, *Nemastylis celestina*, *Herbertia cœrulea*, *Echinocactus Kunzei*, *Opuntia stricta*.

— *Journal des Roses.*—The plate in the May number is devoted to the illustration of *Rose Panachée d'Angers*, H.P.

— *Revue de l'Horticulture Belge.*—A coloured plate is given of *Luculia gratissima* in the June number.

— *Garten Zeitung.*—*Nicotiana affinis* is the subject of a coloured representation in the June number. In the preceding part a description and coloured figure is given by Dr. Magnus of a Potato, a graft hybrid between Mexican and Black Kidney, to which we shall afterwards refer.

Florists' Flowers.

GOLD-LACED POLYANTHUSES.—The establishment of the Southern Show of the National Auricula Society has operated to create quite a new interest in the gold-laced Polyanthus in the South, and old varieties of sterling merit were, and still are, anxiously inquired for, and one satisfactory result has been that attention has been turned to the necessity for raising seedlings, and a considerable amount of success has followed attempts in this direction. Foremost in the work is Mr. Samuel Barlow, of Stakehill House, Castleton, Manchester. The task of raising improved seedling forms could not have been in better hands. Stakehill is essentially the home for florists' flowers. There Polyanthus, Auricula, Tulip, Ranunculus, and other subjects are most carefully and intelligently tended, and many other subjects are cultivated with a tender and unflinching regard. The garden at Stakehill is full of interest—it is a garden of a character one seldom meets with, and when once visited is never forgotten. There, at all times and in all seasons, florists' flowers and kindred subjects are reared and flourish; and no man has acquired the right in such a degree as Mr. Barlow to be looked up to as the leader of the Northern florists. They trust and follow his lead: his great experience, his high character, and his unstinted social courtesies, never fail.

In setting about the improvement of the Polyanthus,

such high-class varieties as Lord Lincoln, Cheshire Favourite and Exile were used as pollen and seed parents. The brilliance of colour found in the former, and the exquisite lacing of Cheshire Favourite appear in the progeny. Seedlings of approved character have in their turn been used as pollen and seed parents. In prosecuting this work many disappointments have ensued; from crosses of which great hopes were formed, nothing but rubbish has come; from others a few prizes have been mingled with the numerous blanks; but something of promise and hope have been secured; and they are but the stepping-stones across the stream along the road which leads to higher results.

Two of Mr. Barlow's earliest flowers are Sunrise and Criterion. Round the former a war of words has raged as to its quality and position among known varieties. As seen in bloom at Stakehill in the early part of this month it represents an exceedingly pretty and distinct red ground flower, bright clear red in colour, good eye, circular centre, and well defined lacing, cutting down to the centre without a break; habit medium in height, and apparently a good grower. Criterion is a black ground flower, as black as Cheshire Favourite, clear golden centre, and a beautiful regular lacing; very bright in appearance, throwing up fine trusses of bloom on stiff footstalks, and good robust habit.

Following these, as of more recent origin, come Fire-fly, deep red ground, golden centre, pure and regular lacing, which goes well down through the centre of the segments to the golden zone round the eye; very pretty and bright in appearance, good habit. Model, red ground, remarkably fine flat and circular pip, red ground, deep golden centre, becoming a trifle clouded with age; broad and regular lacing, a trifle paler in colour than the centre; fine bold truss, and excellent habit. A well developed pip of this variety appears to come very near to what is regarded as a reliable coloured illustration of Addis' Kingfisher, which appeared in the *Birmingham and Midland Gardeners' Magazine*, published in 1851-52, and which variety is now regarded as utterly and irrevocably lost. John Bright is a dark ground flower, with a distinct black ground, deep golden centre, and fine and rather broad lacing, very bright and attractive, but wanting shape; good habit, very free, and highly fragrant. There may be some uncertainty in getting this good enough for show purposes, and of this Mr. Barlow is fully aware; yet it is an exceedingly pleasing variety for pot culture, and will make a rare border flower where quality is appreciated. Harbinger is very like the true form of Cox's Prince Regent, but with a slightly narrower lacing, and a little clouded in the centre; Prince Regent being very clear and bright, Harbinger will make a useful variety for show purposes.

But all these, fine as they undoubtedly are, are only the mediums by which newer and better forms are to be brought to the fore. Some very promising seedlings have opened this season and are marked for future trial, while special crosses have been made for this year's seedling, Model in particular being used as a parent.

A promising seedling named *Zoe*, raised by Mr. William Bolton, of Warrington, was seen at the National Auricula Show at Manchester. It has a rich black ground, fine clear golden centre, with a well-defined lacing of gold, good pip and truss, something like Cheshire Favourite, but of a paler colour both in the centre and lacing. Then Mr. William Brockbank and Mr. James Deswick also have promising seedlings, of which we shall no doubt hear more next year.

Some new Northern flowers have been introduced during the past two or three years, such as Brilliant, Congleton Queen, Staffordshire Queen, and Lancashire Hero. Of these Lancashire Hero was the only one seen at Manchester—a dark ground flower, but not first-rate as shown on that occasion. It is not regarded with great approval by the Polyanthus growers in the North. Of this quartette Congleton Queen has the highest reputation. I have it, but it has not bloomed with me, though a strong grower.

Of the older sorts the best at Manchester were Cox's Prince Regent, one of the leading flowers; Lord Lincoln, very fine, of which a strong plant is flowered—a variety that requires to be grown with great care; Beauty of England, black ground, a variety that, like Exile, is apt to come clouded in the ground colour and cupped in the pip; but, like Exile also, very attractive when clear in the ground, and the lacing well-defined; Cheshire Favourite,

generally good; and Lancer very pretty and effective when in good condition. George IV. was in fairly good condition; here and there a pip or two was perfect; Formosa was, as it always is, singularly bright in appearance, but confused in the ground colour, being neither red nor black, and with the lacing irregular and imperfect.

We are yet some way off the realisation of the typical gold-laced Polyanthus growers and writers have set up as their ideal. Perfect clearness and perfect circularity in the golden centre have yet to be attained, and we are at present further off the realisation of the latter than of the former. A centre, the circumference of which is irregular, imparts to a flower a scolloped appearance, and the symmetry of the whole is thereby impaired. We want the ground colour pure black or pure red, the lacing harmonious in tint with the centre, and well and evenly defined. Then we have not as yet reached onwards to perfect evenness in the parts of the flower as put by Glenny: "The flower should be divided thus—the yellow tube in the centre being measured, the yellow centre round the tube should be the same in width as its diameter, and the ground-colour of the flower should be the same; or draw with the compasses, opened to the sixteenth of an inch apart, a circle for the tube or eye; open them to three-sixteenths, and draw another circle for the centre; then open them further to five-sixteenths, and draw a third circle for the ground colour. Beyond these circles there is a yellow lacing, which should reach down the sides of every segment to the yellow centre, and down the centre of each segment also, and be so much like the edging as that the flower should appear to have twelve similar segments." In this last sentence Glenny assumes that a perfect Polyanthus should have six segments to the flower. To many flowers there are but five only, but the number is variable.

Tested by the required diameter of the tube and zones of colour as set forth by Glenny, what one thinks of the diagrams of gold-laced Polyanthus as occasionally found in illustrated catalogues? Truly, they are wonderfully conceived and fearfully executed. They are burlesques of flowers, and bad burlesques too. They serve as floral decoy birds—that is all.

Let the Polyanthus raiser be encouraged to persevere, for his work, if at all acceptable, will be recognised. In the North a lemon-yellow is preferable to a golden-yellow centre, as being softer and more harmonious in tone. In this respect the true artistic expression and idea is set forth. Let the raiser eschew all big, coarse, clouded, and imperfect flowers that to some appear to represent "prize strains of gold-laced Polyanthus," and let him be not dismayed though some can sell seed of named flowers at 5s. per ounce! He can afford to smile at these absurdities. To him who works and to him who waits there will come a day when he shall be able to present to view cheering results that will raise floriculture a step nearer to the higher level of comparative perfection. R. D.

THE AURICULA.—Those who pot their plants as soon as they are done flowering will now have quite finished. The plants must be rather carefully watered at first, and until the roots have well grown into the fresh soil; indeed, all through the summer months I find it is better rather to under than over water them. The smaller offsets taken from the plants last autumn, and in February last, should now be potted on as they require it; if they are carefully treated they will form good flowering plants for next year. They must not have too large shifts; most of them will flower in large 16's or small 4's. If the general collection has not yet been shifted it is quite time that it was done. I could not get at some of ours until the end of July last year, and I find that those that were late potted did not fill the pots so well with roots as they ought to have done. Among the principal growers there is considerable diversity of opinion as to what is the best potting material. One grower said he would never use any more cow-manure, as very often a white maggot was found in it, which quite ruined valuable plants by eating round their collar; he used stable-manure instead. I have found a mixture of equal parts of cow and stable-manure answer well; and one good grower uses two years old cow-manure. This is a good old-fashioned manure, and I approve of it very much. Four parts good turfy loam, one of manure, one of leaf-mould, and some sharp sand, with a sprinkling of charcoal, is as good as anything.

CARNATIONS AND PICOTEES.—The continued east winds, sometimes bitterly cold, stopped us at bedding-out, and we had a week cleaning, tying-up the flower-stems, and surface-dressing the Carnations and Picotees. They are looking very well this year, and are not so early as we expected by their appearance early in the year. All the attention they require now is to have the flower-stems disbudded as they become sufficiently advanced. We find a good way to destroy greenfly, which clusters on the flower-buds, is to have a small box of tobacco-powder, and look over the plants with a dry camel-hair brush, dipping it in the powder before it is used to brush off the fly. The tree or perpetual flowering section now demands considerable attention. They also must be kept quite clear of insect pests; they should be potted on as they require it, and the growths must be secured to sticks, as few plants are so easily injured by high winds. The best place for them at present is in an open position out-of-doors; the pots to be plunged to half their depth in cocoa-nut fibre refuse.

DAHLIAS.—As soon as the weather is favourable the plants should be put out. It would be a mistake to plant them during dry gusty east winds. If the plants are likely to become pot-bound, it is always much better to re-pot them into a size larger than to plant out too early. The ground has, of course, been prepared long ago, and ought now to be in good condition. To do the flowers well for exhibition the plants should be at least 5 feet apart. I would again urge the importance of putting in the stout permanent sticks at once, and plant out against them; the side-sticks may be put in afterwards. Slugs are often troublesome in the early stages of the plant's growth, and do much damage if they are not looked after. Earwigs should also be trapped early; their destruction now may save much vexation by-and-by. Look after the slugs at night with a lamp, and trap the earwigs in small pots on the top of the sticks. Invert the pots, and place a little dry moss in the bottom of them. It is a good plan to place a mulching of rotten manure round the plants as soon as they are planted. *J. Douglas.*

The Poultry Yard.

FEEDING YOUNG CHICKS.—Chicks of various ages will now be plentiful, and good feeding, with the mild weather now experienced, will bring them fast forward. A free and plump growth and early maturity is always desirable, no matter whether they are intended for the table, laying, or showing; chickens which are half-starved when young never make fine adults, and stunted rearing may show itself for years in the stock. Cramping with all kinds of luxuries we do not approve of, and forcing foods are to be avoided in all fowls which are intended for stock, but giving them as much as they will eat readily of sound wholesome food will always be productive of much good. Few creatures change more with the weather than fowls. In wet dull weather the strongest of them will go moping about and brighten up with sunshine, and in the case of young chicks their food should be varied accordingly. Plenty of soft food is the proper thing in hot dry weather, but during wet periods grain should be their chief meals. It is by having regard to a rule like this that we often attribute the unusual healthfulness of our young flocks. Spratt's Patent Meal is the best of all such foods for poultry. Three or four handfuls of it placed in a dish and covered over with water will swell out to three times its original size in a very few minutes, and it should always be treated in this way before giving it to the fowls. They may have it pure, or it may be mixed with a little barley-meal. Soaked bread-crusts are a good change of food, and barley-meal is always a staple food. Oat-meal is excellent when boiled before using, but it is rather expensive, and should only be given occasionally to choice stock; ordinary Wheat and Buckwheat are, too, good feeding grains. Indian corn is very fattening, and not very healthy if given often and largely. Oats are a good change from the Wheat. Until they are a fortnight old chicks should be fed every two hours, but afterwards the times may be reduced to four times a day, and then to three, always giving as much as they will eat, but never any to waste or lie about the ground afterwards, as this will soon give them a distaste for food, and be a great loss as well. Giving food very early in the morning, say at 4 A.M., just now, will bring them on at a wonderful

rate. They are always inclined to be out and about in the mornings, and consume their food more readily than late in the evening. When first we took to chicken rearing, and were encouraged by gaining prizes at some of the largest shows, we have frequently got up at 4 A.M. to give them their first meal, and this agreed so well with all that we cannot do better than advise its general adoption.

GAPES IN CHICKENS.—This is a very common disease among young chickens. Its presence is indicated by little coughs or sneezes. It is said to be caused by a worm in the throat, and whether they increase in number or size is open to question, but if not checked they take a powerful hold on the chickens, as they become quite weak, droop their wings, refuse food, and ultimately die. Dozens may be lost in this way if a sharp eye is not kept on them. At an advanced stage we never hope to cure, but on the first indication we have always a certain check in putting a piece of camphor in their drinking water. To a pint of water we add a piece of this about the size of a hazel-nut, and it floats about until it is all dissolved. As the water is changed it is shifted too, and as a prevention of gapes, and other diseases as well, this remedy is both simple and effective.

BROODY HENS.—Early in the season these are in great demand, but now, when they are much more plentiful and less wanted, they are regarded by many as a nuisance. Few eggs will be placed under them now, as the hatching season is well-nigh over, and the best way is to put them off their sitting habit as soon as possible. If allowed to sit for any length of time they will soon be reduced in condition and not lay again for a long time, but if put off at once they will lay again very soon, and thus become profitable. A change of run is almost a certain cure for broodiness, or shutting them up with nothing to sit on for two or three days will generally effect a cure.

WEEDING OUT.—In all good poultry yards this is a practice which finds much favour during the summer months, and that, too, before many of the youngsters are fully grown, as it gives the superior birds more room and avoids overcrowding, which is always to be recommended. When quite small it can generally be told which are most likely to be the finest in the end, and the inferior ones should be disposed of as soon as possible. Many will buy these at a reduced price, or they may be penned up and fattened quickly for killing. Prize poultry keepers are always anxious to let the cream of their young stock have as much room as possible, as overcrowding is injurious to the full and perfect development of the best of the birds, and this rule applies to all fowls.

OLD STOCK.—If poultry keeping is to be made to pay at all, nothing but healthy young birds must be kept; and all fowls, excepting some choice prize ones, should be killed off after they become two years old at least. Now, when plenty of young ones are coming forward, is a good time to kill or sell away all the old ones. They may be kept until they cease laying, but not a week longer, as it will be many a day before they lay again, and then, being so old, they would never lay sufficient eggs to pay for their keep. *Henwife.*

Reports of Societies.

The Wakefield Amateur Tulip Society: *May 29 and 30.*—This was the forty-seventh annual exhibition of this Society, it having been established as far back as 1835. The show took place in the large club-room of the Iron-works Hotel, Borough Market, and a series of tables occupying the middle of the room was quite filled with flowers. The Tulip is cultivated about Wakefield with a great deal of enthusiasm, and the exhibitors are almost mainly confined to working men and small tradesmen, and the show-making class appears to be well represented among the growers. The best pan of six-recurred Tulips was shown by Thomas Gill, Crigglestone—flamed bizarre Sir J. Paxton and feathered bizarre Wallace, flamed byblomen Lord Denman and feathered byblomen Majestic, flamed rose Lady Catherine Gordon, and feathered rose Industry; 2d, Mr. George Gill, Eastmore, with flamed bizarre Sir J. Paxton and feathered bizarre Lord Lilford, flamed byblomen Maid of Orleans and feathered byblomen Lady Denman (which is flamed byblomen Lord Denman in a feathered form), flamed rose Agonia, and feathered rose Minerva. Mr. R. Sharpley, Silver Street, was 3d, with flamed

byblomen Sir J. Paxton and feathered bizarre Lord Lilford, flamed byblomen Adonis and feathered byblomen Lord Raglan, flamed rose Mrs. Lea and feathered rose Fanny. Ten prizes were awarded in this class, so some idea can be obtained of the number of Tulip cultivators in the neighbourhood of Wakefield. In the class for six breeders, Mr. R. Sharpley, who had a fine collection of unbroken flowers, was 1st with bizarres Lord Frederick Cavendish and Sir J. Paxton, byblomen George Hardwicke and Hardwicke's Seedling, roses Queen of England and Mabel, 2d, Mr. T. Gill, with bizarres John Brook and Nancy—the last a very striking yellow flower—the shape byblomen Duchess of Sutherland and Maid of Orleans, roses Queen of England and Catherine, 3d, Mr. J. Nettleton, Warren Gate, with bizarres Sir J. Paxton and John Bright, byblomen seedlings and roses Mrs. Longbottom and Mrs. Jeffery. Eight prizes were awarded in this class. The best three breeders, one in each class, came from Mr. Thomas Spurr, Veiarage Street, who had bizarre John Brook, byblomen Ethel Rose Longbottom; 2d, Mr. R. J. Sharpley, with bizarre Dr. Hardy, byblomen George Hardwicke, and rose Lady Grosvenor. Ten prizes were awarded in this class.

In addition there were classes for single flowers of each division, both feathered and flamed, and also for breeders in each division, and of these a large number of flowers were staged, and the judges had a somewhat difficult time to set them. The best feathered flower was John Brook, bizarre, from Mr. R. J. Sharpley; the best flamed flower Lord Denman, byblomen, from Mr. T. Gill; and the best breeder John Brooks, bizarre, from Mr. T. Gill. Looking over the flowers staged on this occasion, which for variety and beauty of development were of a most commendable, we noticed as the best in each class:—Flamed bizarres, Sir J. Paxton, Dr. Hardy, John Brook (a very good flower indeed, of local origin), and Ajax. The best feathered bizarres:—Lord Lilford, shown very fine, and of which variety there appears to be an excellent strain in the neighbourhood of Wakefield, George Hayward, the Wallace, and Everard. Flamed byblomen:—Lord Denman, Maid of Orleans, very showy indeed; and Mr. Jackson, Feathered byblomen:—Wilson's Queen, Bessie, Adonis, Majestic, very fine indeed; and Mrs. Gill, Flamed bizarres:—Industry, and Mrs. Minerva. Feathered roses:—Mrs. Lea, Heron, and Industry. The exhibition is shown open free to the public, and the money given in prizes is obtained by subscriptions from members and from the general public, and also by means of entrance fees.

Scottish Horticultural Association.—The ordinary monthly meeting of this Association was held in 5, St. Andrew Square, Edinburgh, on Tuesday, June 6, the President in the chair. Mr. W. E. Dixon, Brechin, on the subject of the "Finger and Thumb" form of Plants," dividing his subject into two heads, viz., the nature of variegation, and its causes. It was a subject which had caused a great deal of discussion in scientific circles, having received a considerable amount of attention from the Brussels Congress of 1854. By some it was maintained that it was a hereditary character, and had been introduced in Japan for some length of time; while others held that it was a disease, and was a sign of weakness in plants. Mr. Dixon then enumerated the different forms of variegation, and quoted at considerable length the opinions of many men who had given this subject their attention.

Mr. P. W. Fairgreive, Dunkeld Gardens, exhibited a large plant of *Phorium tenax Veitchii* in flower, to which was awarded a Cultural Certificate. It was agreed to send a special vote of thanks to the Dowager Duchess of Argyll for exhibiting such a fine plant. Messrs. Dickson & Co., Edinburgh, received a Certificate for *Populus Boleiana*, introduced into Germany from Tashkend; they also received Certificates for a show Pansy, named President Grieve, and a fancy Pansy, named Evelyn Prince; and also exhibited *Saxifraga MacNabiana*, &c. Messrs. Downie & Laird received two Certificates for two fancy Pansies—May Tate, and Miss Maggie Morrison. Mr. A. Paul, Gilmore Place, received a Cultural Certificate for a collection of Orchids which he exhibited, the principal one in the collection being *Odontoglossum vexillarium*. Mr. J. H. Morrison, Strathgairn, exhibited a new Rose, named Stirling Castle. Mr. M. Chapman, Easter Duddingstone Lodge, exhibited several hardy plants in flower, viz., *Oursia coccinea*, *Spiræa*, *Cypripedium spectabile*, *Eurybia tomentosa*, &c. Mr. Bowie, Chillingham, exhibited a new Coleus, named Lord Bennett.

ACHIMENES VERSCHAFFELTI.—When one recognises an old acquaintance in a new shape, the mind naturally reflects back over a number of years, and the changes that have taken place in plant growing are vividly brought to the recollection. How few Achimenes are grown now-a-days compared to what there used to be. The specimen which is the subject of these remarks is a beautiful basket plant in the garden of Mrs. Thornton West, Streatham Hall, Exeter. It is grown globe-shape by simply filling the basket in the usual way and inserting the tubers in the surface of the soil to a depth of a few inches below the rim of the basket. The rest is done by a simple method of training, or pegging, to use a common term. When the tubers are set in the basket, those that grow out at the sides of the basket are trained downwards, in order to form a complete globe, and now that the plants are in full flower it would be hard to find a more handsome floral ornament.

PLANT PORTRAITS.

ABELIA SPATULATA, Sieb. and Zucc., *Bot. Mag.*, t. 6601.—A Japanese shrub introduced to Messrs. Veitch's establishment by Mr. Maries. It has lanceolate, coarsely-toothed leaves, and greenish, funnel-shaped flowers provided at the base with a small calyx of full ovate rosy segments.

ÆCHMEA GLAZIOVII, Baker, *Belg. Hort.*, t. xliii., 1881.—Leaves tufted, broad at the base, strap-shaped, obtuse coarsely toothed; flowers reddish, in a dense branching panicle.

BOUVDARIA ALBERT NEUNER, *Illustr. Hort.*, t. 437.—A charming greenhouse shrub, with trusses of double white flowers, having a superficial resemblance to those of the double Lilac, but white. It is said to be a variety of *B. Davidsoni*, and is of American origin.

CASCIMUM LITTLE GEM, *Floral Mag.*, t. 479.—A charming little bush for winter decoration, with dwarf, much branched, compact habit, small ovate acute leaves, and a profusion of small ovoid scarlet berries. Mr. B. S. Williams.

COLEUS CRIMSON VELVET, *Floral Mag.*, t. 478.—Leaves ovate acuminate, coarsely toothed, rich crimson. Mr. Ed. Cooling.

CYPRIPEDIUM EURYANDRUM, *Revue de l'Hort. Belg.*, January.

CURCULIGO RECURVATA, Dryander, *Revue de l'Hort. Belg.*, January.

DAHLIAS, *Floralist*, February, t. 555.—Show varieties. 1, Pioneer, very dark maroon, medium size, excellent form, dwarf habit; 2, Duchess of Wellington, florets white, tipped with pink, medium size, dwarf habit. Both raised by the Rev. C. Fellows.

DAHLIAS, single varieties, *Garden*, December 31.—This plate of varieties grown by Mr. Ware ought to foster the growing taste for these beautiful flowers, which have the vividness and variety of colour of the show Dahlias without their stiff form.

GENTIANA FETISOWI, G. OLIVIERI VAR., *Gartenflora*, t. 1069.—The first is a tall-growing perennial, with lanceolate or oblong-lanceolate glabrous leaves, and dull blue funnel-shaped flowers in groups at the top of the stem. Native of Turkestan. The second species is also from Turkestan, and has linear leaves, and densely crowded terminal flowers of deep blue.

INCARVILLEA COMPACTA, Maxim., *Gartenflora*, t. 1065.—A beautiful Bignonaceous plant, native of the mountainous regions of Kansu, N.W. China, with tufted or ultimately scattered fleshy, glabrous, unequally pinnate leaves, with short, ovate-acute segments. The funnel-shaped flowers are in dense clusters, each measuring about 2½ inches in length, and of a bright rose-pink, with the limb divided into rounded lobes. It is probable this plant may prove hardy; in any case it will be a great acquisition.

LILIUM PARKYI, *Floralist*, January.—Flowers funnel-shaped, with recurved segments, yellow, spotted with red. South China.

LILIUM POLYPHYLLUM, *Floralist*, January.—Flowers funnel-shaped; segments recurved, whitish, tinged with yellow, and marked with reddish-purple spots and lines. Western Himalayas.

LINDENIA RIVALIS, *Garden*, December 24.—Stove evergreen, with lanceolate leaves; white flowers, with very long slender tube and rotate 5-lobed limb. Rubiacæ.

MONTURETIA CROCOSMIFLORA ×, *Belg. Hort.*, t. xiv., 1881.—A hybrid raised between the pollen of *Trifolium aurea* and *Montbretia Pottsi* by M. Lemoine. The plant has the habit of a *Gladiolus*, the panicle is many flowered, erect, bent in zig-zag fashion; the flowers are about 1½ inch long, funnel-shaped with slender curved tube, and a spreading 6-parted orange-scarlet limb, with three deflexed stamens.

NEPHRODIUM RODIGASIANUM, T. Moore, *Illustr. Hort.*, t. 442.—A handsome stove Fern from Samoa, with arching fronds, each a yard or more in length, pinnate, the pinnae lanceolate, toothed.

ONCIDIUM INSCURVUM, Barker, fl.-alb., *Illustr. Hort.*, t. 443.—A species with much-branched, free-flowering panicles, the flowers with narrow, spreading segments, white flushed with rose. Mexico.

PEACH WATERLOG, *Floralist*, January.—An early ripening Peach of medium size, and globose form, with a deep saucer and prominent nipple; skin greenish-white, deepening into crimson-purple; flesh greenish-white, melting, juicy, vinous, somewhat adherent to the stone.

PITCAIRNIA CORALLIOHA, Lindl. and André, *Bot. Mag.*, t. 6600.—A fine Bromeliad, with long lanceolate plicate nearly glabrous leaves, recurved in the middle; racemes elongate, many-flowered, pendulous, the individual flowers brilliant crimson, about 3 inches long. It is a native of New Grenada, the plant figured flowered in the garden of Sir George Macleay.

PLUMS, *Floralist*, February, t. 556.—1, Archduke, a late Plum, good for table or kitchen; a good cropper; fruits blunt obtuse, deep violet; 2, Reine Claude du Comte Hatthem, a delicious purple Gage, and an abundant cropper. Fruit subglobose, claret-purple; and recommended by Mr. Rivers.

QUESNELIA VAN HOUTTEANA, Hort. Van Houtte, Morren, in *Belg. Hort.* 1881, t. xviii. A Brazilian Bromeliad with thick, oblong, strap-shaped, concave, acute, coarsely-toothed, ascending leaves, and long, dense, cylindrical spikes of blue flowers supported by red-tipped bracts.

ROSE BOEILDEU, *Journal des Roses*, January.—A H.P. Rose of large size, bright rose-pink colour, and good globular form. It was sent out by M. Margottin, and is stated to be a seedling from Jules Margottin crossed with Baron Prevost. The Editor speaks warily in its praise.

ROSE GUILLAUME GILLEMOT, *Illustr. Hort.*, t. 438.—A hybrid perpetual, raised by Mr. J. Schwartz from Madame Charles Wood. The flower is large, globular, rose-scarlet, and very sweet-scented.

ROSE MADAME BECARD, A Tea Rose.—A crossed seedling, between Gloire de Dijon and Mad. Falcot, the latter being the pollen parent. Flowers salmon-yellow, with a copper-coloured centre. A general favourite.

SANIERAGA DIVERSIFOLIA, Wallich, *Bot. Mag.*, t. 6603.—A species with the habit of *Paraschia*, growing also in boggy places. The lower leaves are strong-stalked, glabrous, cordate, ovate acute, the upper sessile amplexicaul; the inflorescence terminal cymose numerous yellow flowers. Native of the Himalayas with from east to west. Hort. Kew.

SELENIA AUREA, Nuttall, *Bot. Mag.*, t. 6607.—A yellow-flowered, glabrous, Cruciferous annual, with linear-oblong pinnatifid foliage. The flowers are sweet, and remain for a long time in perfection. Rocky Mountains. Hort. Kew.

SOLANUM BETACEUM VAR. COCCINEUM, *Rev. Hort.*, December 10.—A variety with long, ovoid fruits of a deep red colour; very ornamental.

TILLANDSIA LINDENI SPLENDIDA, *Rev. Hort.*, January 1, differs from the type in its free-flowering habit. It is one of the series with broad, flattened inflorescences with rose-coloured bracts, and large purplish-blue flowers. Thibaut & Keteleer.

TROPÆOLUM EMPRESS OF INDIA, *Floralist*, December.—One of the very best of the new annuals, with close habit, dark blue-green foliage, and dark brilliant crimson flowers. Messrs. Carter & Co.

VALLOTA PURPUREA, Herbert, *Revue de l'Hort. Belg.*, January.

VERATRUM MAACKI, Regel, *Gartenflora*, t. 1070.—A species from Ussuria, in habit and colour of flowers very like *V. nigram*.

VITIS LECARDI, V. Durandii, V. Chantini, V. Faidherbi, V. Hardy; *Rev. Hort.* 1881, p. 455.—Woodcut illustrations representing more or less imperfect specimens of Vines from Soudan, introduced by the late M. Lecard, and which that sanguine explorer thought might be cultivated advantageously in any country where the mean temperature amounted to 15–16° C. for three or four months.

ZEPHYRANTHES CITRINA, Baker, *Bot. Mag.*, t. 6605.—A pretty yellow-flowered species, introduced from Demetera by Messrs. Veitch, and the more interesting in that all the other species are white or red. The stigma lobes, too, are roundish. A bulbous Amyridyl, with linear leaves and long stalked funnel-shaped flowers.

AMARYLLIS MRS. GARFIELD.—This fine variety, for which Mr. B. S. Williams last year obtained a First-class Certificate from the Floral Committee, proves with longer acquaintance to possess a more accommodating habit as regards the time and season of its flowering than was at first anticipated. Mr. Williams is seldom without a plant in flower during several months of the year, and by reason of its white banded leaves, and white blooms beautifully veined with rose-pink, it is always an appreciated flower. It is quite one of the best in a family that now contains many striking novelties.

The Weather.

June 1.—Fine overcast morning. Very fine bright afternoon with a few clouds. Fine night, sky cloudy.
 2.—A dull and overcast day; windy; rain at 6½. Cloudy night.
 3.—Fine day, sky generally overcast; showery; hail at 4½. Fine night.
 4.—Dull morning, fine deep blue sky when visible, no upper clouds; frequently clear. Heavy rain between 6h. and 7h. at night.
 5.—A dull, windy, overcast day. Dull night.
 6.—A very dull, rainy day. Dark sky at night.
 7.—A fine morning, gleams of sun at times. A shower of rain at 2.20 p.m., afterwards fine and bright. Fine clear night.

LONDON: Atmospheric Pressure.—During the week ending June 3 the reading of the barometer at the level of the sea decreased from 30.29 inches at the beginning of the week to 30.09 inches by 9 A.M. on the 28th, increased to 30.32 inches by 9 A.M. on the 29th, decreased to 30.31 inches by 3 P.M., and increased to 30.33 inches by midnight of the same day; decreased to 30.25 inches by 3 P.M. on the 30th, increased to 30.29 inches by 9 A.M. on the 31st, decreased to 30.28 inches by 3 P.M. on the 31st, increased to 30.35 inches by midnight of the same day, and was 29.76 inches by the end of the week. The mean reading for the week at the level of the sea was 30.17 inches, being 0.41 inch higher than last week, and 0.20 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 74°.2, on the 29th. On June 2 the highest temperature was 62°.5. The mean of the seven high day temperatures was 69°.3.

The lowest temperature in the shade in the week was 45°.5, on June 1; on the 3d the lowest temperature was 54°. The mean of the seven lowest temperatures was 50°.2.

The greatest range of temperature in one day was 24°.1, on the 29th; the smallest was 12°.5, on June 2. The mean of the seven daily ranges was 19°.1.

The mean temperatures were, on the 28th, 59°.4; on the 29th, 60°.4; on the 30th, 60°.3; on the 31st, 56°.5; on June 1, 53°.8; on the 2d, 55°.2; and on the 3d, 60°. of these those of June 1 and 2, were 2.7 and 1.5 below their averages, and the rest were above their averages by 3.8, 4.6, 4.3, 0.2, and 3.1 respectively.

The mean temperature of the air for the week was 57.9, being 0.6 higher than last week, and 1.9 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 151°.5, on the 29th; the highest on the 2d was 92°.5. The mean of the seven readings was 129.7.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 41°, on May 29 and June 1. The mean of the seven readings was 43°.9.

Rain.—Rain fell on two days, to the amount of 0.06 inch in the week.

ENGLAND: Temperature.—During the week ending June 3 the highest temperatures were 78°.2 at Nottingham, 76° at Cambridge and Sunderland. The highest temperature at Bristol was 66°, at Bolton 66°.2, and at Liverpool 66°.9. The general mean was 70°.7.

The lowest temperatures in the week were 37°.6 at Cambridge, 40°.3 at Bristol, and 41°.5 at Leicester. The lowest temperature at Plymouth was 49°, at Liverpool 47°.8, and at Brighton and Sunderland 46°. The general mean was 43°.6.

ADIE'S PATENT LAWN EDGER.

THIS Machine constantly employed with myself on two days. Dr. Hogg, in the *Journal of Agriculture*, says—"This Edge-Clipper we have tried, and know that which to admire most—its simplicity or efficiency." Mr. Moore, in the *Field*,—"This new machine does its work rapidly and admirably, the grass being cut with precision, and" he further adds, "the use of it will, we have no doubt, become general." Price 25s. 15, Pall Mall, London, W.

THE NEW GARDEN HOSE, made upon the principle of the fire hose used by Captain Shaw, C.B., Chief Officer of the Metropolitan Fire Brigade. It is much cheaper and far more durable than white rubber, or fabric hose. Private customers supplied at trade prices. Sample free. **MERRYWEATHER AND SONS,** 65, Long Acre, London, W.C. Works, Greenwich.

HOSE—HOSE—HOSE. PATENT RED-RUBBER GARDEN HOSE.

Stands severe tests of Government Departments, thus proving superiority of quality. Lasts four times as long as ordinary India-rubber Hose, Lighter in Weight, Greater in Strength, and Cheaper in the long run than any other Hose for Garden Use.

A correspondent writes:—"I have had a length of your Red-Rubber Hose to use nine years, and it is now as good as ever."
Private Customers Supplied at Trade Prices.

Sample and Price of **MERRYWEATHER & SONS,**
 Manufacturers, 65, Long Acre, London, W.C.

ALPHEBY & CO.,

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

THIS VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertiser, and its genuine good qualities were the best we ever had. Address Varnish to Piercefield Park, Chepstow. — I am, Sirs, yours respectfully, **WM. COLE & SUTHER** would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is highly marked with their name and Registered Trade mark as above, without which none is genuine. Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to **HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.**

UNSOLICITED TESTIMONIAL. *Piercefield Park, June 21, 1876.—20s.—* I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefield Park, Chepstow. — I am, Sirs, yours respectfully, **WM. COLE & SUTHER** would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. NEIGHBOUR'S
IMPROVED
COTTAGE BEE-HIVE

as originally introduced by
Geo. Neighbour & Sons,
working three bell-glasses,
is neatly and strongly made
of straw; it has three
windows in the lower Hive.

This Hive will be found to
possess many practical ad-
vantages, and is more easy
of management than any
other Beehive that has
been introduced.

Price, complete £1 15 0
Stand for ditto 0 10 6

PHILADELPHIA BAR-FRAME HIVE, from which the
Combs can be removed at side opening whilst supers are on.
This Hive affords remarkable facility for manipulation, because
the frames can also be taken out from top as with other Frame

Hives, and at the same time afford great opportunity for full
inspection, having glass on three sides closed with shutters.
Price, complete, with Cover and Stand, 42s.; also Bar-
Frame Hives, of most approved construction, at 7s. 6d., 12s. 6d.,
to 15s. each.
AN ITALIAN ALP QUEEN, with full directions for
uniting to Black Stocks, at current prices.

GARDENER, in a Gentleman's establishment, and fill up spare time in the Garden.—Age 40, single.—C. 34, Chester Terrace, Chiswick.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine principles which regulate the action of the primevial organs, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are reeling about us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—Civil Service Gazette.

James Epps and Co., Sole Importers, 10, BUCKLEPATRIC CHEMISTS, London.

Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S OINTMENT and PILLS.—Never Falt.—In all Irritations of the Skin, Scars, Ulcers, Burns, and Scrofulous Enlargements of the Glands, Holloway's Ointment presents a sure and easy means of relief, which never disappoints the most favourable expectations. It manifests a potent and peculiar power in restraining Inflammation, Removing Scarcation, Cooling the Heated Blood, and Checking all Acrimonious and Purulent Discharges. Whilst thus acting locally, the Pills are no less remarkable for their power in improving the general condition and habit of body, which renders the latter complete and permanent. Under the general influence of these potent remedies, the purify animal becomes the robust child, the pale and emaciated regain colour and flesh and the dyspeptic eats freely, without fear.

GRAPEFUL AND COMFORTING.

Made simply with boiling water or milk. Sold only in packets, labelled.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1856, And Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

Single-handed Lawn Mower.

To cut 6 inches	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches	2 10 0
Can be worked by a Lady.	
To cut 10 inches	3 10 0
Can be worked by a strong Youth.	
To cut 12 inches	4 10 0
Can be worked by a Man.	
To cut 14 inches	5 10 0
Can be worked by a Man.	

Double-handed Lawn Mower.

To cut 16 inches	Price £6 10 0
This can be worked by One Man on an even lawn.	
To cut 18 inches	7 10 0
By a Man and Boy.	
To cut 20 inches	8 0 0
By a Man and Boy.	
* To cut 22 inches. By Two Men ...	8 10 0
* To cut 24 inches. By Two Men ...	9 0 0
* It made stronger, suitable for Donkey, 30s. extra.	
* Cross-stay complete, suitable for attaching	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, with Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

PRICES.

Without Grassbox.

To cut 6 in.	£1 10 0
To cut 7 in.	1 8 0
To cut 8 in.	1 15 0

This Mower is specially designed to meet an almost universal want experienced by those who have small lawns or grass plots, to have a good and useful machine at a low price. The inventor having seen this want continually increasing, year by year, has brought out the Mower to meet the requirements of the public by supplying a good and useful machine at a cheap rate.

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c.; it is a most handy, serviceable machine, and very easy to work.

PRICES.

With Grassbox.

To cut 6 in.	£1 15 0
To cut 7 in.	1 13 0
To cut 8 in.	2 0 0

GREEN'S PATENT GRASS EDGE CLIPPER. GREEN'S PATENT ROLLERS

Specially designed to cut the overhanging grass on the edges of walks, borders, flower beds, &c., and to do away with the tedious operation of cutting with shears.

SIZE and PRICE.

Wide.	Diam.
8 inch	7 inch
Packing Case, 2s.	

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inward, so that the unsightly marks which other Rollers leave are avoided by ours.

PRICES.

Diam. Length	£ 1 s d
16 in. by 17 in.	2 15 0
20 in. by 22 in.	4 0 0
24 in. by 26 in.	5 0 0
30 in. by 32 in.	9 0 0
Prices of Rollers, fitted with Shafts suitable for Horse and Pony, on application.	

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Garden Seats and Chairs, and Horticultural Implements of every description, Wire Netting, &c., &c.

Descriptive Illustrated Price Lists free on application to

THOMAS GREEN & SON (Limited), Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London.

SALES BY AUCTION.

Wednesday Next.

IMPORTED and ESTABLISHED ORCHIDS. MR. J. C. STEVENS will SELL by Auction at the ATHLETIC Grounds, Covent Garden, W.C., on WEDNESDAY NEXT, June 21st, at half-past 12 o'clock precisely, a large importation of ORCHIDOPSIS, including in particular a fine specimen of MASDEVALLIA CHIMERA, upright-flowering variety; MASDEVALLIA TROCHILUS, MAXILLARIA VENUSTA, and ONCIDIUM species from various Shrublands, &c. &c. Also several small COLLECTIONS of ESTABLISHED ORCHIDS, including many fine species; RUSTIC WORK, LAWN BASKETS, GARDEN CHAIRS, SEATING, BASKETS, CONSERVATORY STEPS, ORCHID BASKETS, &c. On view morning of Sale, and Catalogues had.

Thursday Next.

DENDROBIUM JAMESTONUM. MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 33, King Street, Covent Garden, W.C., on THURSDAY, June 22nd, at half-past 12 o'clock precisely, a fine importation of this superb DENDROBIUM. It is probably the finest of the genus, and bears large white flowers lasting a long time in perfection, and its coming into bloom at the commencement of the exhibition season makes it especially valuable. Also other importations, such as a lot of ODONTOGLOSSUM ALEXANDREI and others, to which will be added some choice Orchids in flower. On view morning of Sale, and Catalogues had.

J. FAHLETON will be glad to treat with FLORISTS, &c., REQUIRING LAND and GLASS HOUSES, as he is prepared to LET or LEASE or SELL at moderate prices, LAND admirably adapted for all their requirements, in plots of 1/2 to 10 acres—J. FAHLETON, 40, York Road, close to Waterloo, S.E.

A Bargain.

TO BE DISPOSED OF, at a great sacrifice, an excellent NURSERY and SEED BUSINESS—Apply to Messrs. HURST AND SON, Seed Merchants, 157, Houndsditch, London.

RETAIL SEED and FLORISTS BUSINESS FOR SALE, situated in one of the best positions in the City of London, and an opportunity rarely to be met with for a young and active man with moderate capital. For full particulars apply, by letter only, to Z. Hurst & Son, 157, Houndsditch, E.

FOR SALE, a FLORIST and JOBBING BUSINESS, three Greenhouses. Good position. In present house, or in new one through illness. Mr. SMITH, Florist, Uxbridge Road, Ealing, Middlesex.

TO BE LET, as a Going Concern, on September 29, or earlier if desired, a compact NURSERY and small SEED BUSINESS, situated in the best part of Staffordshire, comprising about 2 acres of well-selected Nursery Stock, about 2 acres of Old Turf Land, and a Puddling House, a large stock of Hollies in variety, which do well here, as does all other Nursery Stock, the Soil being deep, Loam, and a never-failing supply of water on the ground. It has been established nearly sixty years, and declining health is the sole cause of disposing of it. For particulars address R. S. R. Bennett Cooper, Esq., Seed Merchant, 93, Southwark Street, London, S.E.

To Florists and Others.

TO LET, on LEASE, a HOUSE, only £35 per ann., fitted with every convenience, and with Garden 1/2 to 2/3 acres. Abundant supply of pure water, and 1/2 acre of garden, with 1/2 acre of Subsoil at gravel and well adapted for Florists, Nurserymen, &c. About twenty minutes to the Fulham Station, South-Western Railway. Full particulars apply to Mr. J. EMELTIN, Solicitor, House, New Hampden, 49, York Road, Waterloo Station, S.E.

Waltham Cross, Herts.—(No. 5672.)

Thirteen miles from Liverpool Street, on the main Cambridge line of the Great Eastern Railway.

TO BE LET, on Lease, about 2 Acres of productive NURSERY LAND, with Cottage, Outbuildings, and about 1200 sq. Yards of Glass, particularly adapted for Fruit Growing. Terms and particulars may be had of Messrs. PROTHORP and MORRIS, Auctioneers, 8, New Broad Street, London; or of Mr. J. S. DUFFMAN, Auctioneer, Crossbrook Street, Chesham.

DESIGNS Made and Works EXECUTED.

PULHAM & SON, The Works, Broxbourne, Established in 1837.

To Nurserymen and Seedsmen and their Assistants.

THE COMMITTEE of the SCOTTISH FRUIT AND VEGETABLE ASSOCIATION hereby offer a First Prize of Seven Guineas, and a Second Prize of Three Guineas for an ESSAY on "The Liability of the Tomato Plant to Spout, and Describing the Various Diseases to which it is liable." The subject of the Essay is to be sent to the Secretary of the Association, on or before December 1 next.

MANSION HOUSE, LONDON.

Grand Rose Show

WILL BE HELD AT THE MANSION HOUSE, ON FRIDAY, JUNE 30, 1882, IN AID OF THE FUNDS OF THE ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO BRIDGE ROAD, AND THE Convalescent Home for Scarlet Fever Patients.

The Exhibition, which will be arranged by Mr. J. Forsyth Johnson, Horticultural Director of the Alexandra Palace, will consist of 10,000 ROSES from the gardens of the principal growers, arranged with Ferns and other accessories in an artistic manner, and of a Competition confined to Amateur Growers.

All Roses to be grown by Exhibitor, and exhibited in boxes to be shown as from the exhibitor. Any buds and leaves may be left, but no loose leaves to be added. Added foliage will be disqualify.

All the exhibited Roses, unless reserved, will be sold at fixed prices, and delivered at the close of the Show at 7 1/2 p.m. All exhibits to be ready for judging by 10.30, or they will not be eligible for competition.

Entries to be made on or before June 27, addressed to the Secretary, Mansion House.

Novelty.

GRAND NEW BEDDING PLANT.

LOBELIA "ANDREW HOLMES." This splendid variety is now offered as the best Lobelia extant. It is possessed of a hardy growth, compact, cushion-like habit, and square flowers, 1 1/2 inches in the face-front of the many really good Lobelias now before the public. It has a good compact habit, very floriferous, and in colour not unlike Gentiana verona, one of the loveliest alpine gentians ever seen become a tower favourite. J. F. FIELDEN. To Mr. Geo. HOLMES. Price 12s. each, 9s. per dozen, 6d. per 100. The usual discount to the Trade. GEORGE HOLMES, Florist, York.

For Present Planting.

KING'S ACRE, near Hereford.—May, 1882

DANIELS' CHOICE STRAINS OF FLORISTS' FLOWER SEEDS, For Present Sowing, Post-free.

25/- In the Raising of Florists' Flowers from Seed, the first essential point is to secure carefully hybridized Seed, a seed from the finest parent of the first kind, the chances of success in raising some really good varieties being, really speaking, from a few plants from seed of the choicest quality than from a large quantity raised from seed of an inferior description.

DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

GRASS SEEDS

For LAWNS, Of the finest close growing Evergreen kinds, 1s. per lb. Special preparations for all purposes, soils, and situations. Advice gratis.

Unselected Testimonials:—

"Knowing how difficult it is to obtain pure stocks of grass seeds, even when price is a secondary consideration, I write to say the supply I obtained from you for our new terrace lawn has given the greatest satisfaction. Please send me three bushels of the very best Lawn Grass Seeds, suitable for an exceedingly hot upland soil. The seed I have had of you has been the only kind which has been able to resist the influence of the sun and drought upon my lawn, gravely sold."

FARM SEEDS

Of all kinds, which have given unqualified satisfaction. See Illustrated and Descriptive LIST, free on application.

UNSURPASSED FLOWER and VEGETABLE SEEDS. LIST Free by Post.

Awarded 1st Prize at the Sydney Exhibition, 1880. Awarded 1st Prize at the Melbourne Exhibition, 1881. Also awarded Silver Medal at the Royal Horticultural Society, June, 1881, for collection of Garden Implements, Tools, &c., &c.

"THE COVENTRY."

(REGISTERED).

NETTLEFOLD & Sons desire to call especial attention to their "COVENTRY" LAWN MOWER, which they can confidently recommend as the best and cheapest in the Market. It has all the improvements which have of late been introduced into this class of Machine, either in England or America; and for the manner in which it does its work, its lightness, and the ease with which it can be used, cannot be surpassed. Its cheapness brings it within the reach of every one, and in this respect it defies competition with any machine before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with ROLLERS AT SAME PRICE, and GRASS BOXES at a small extra cost.

EXHIBITION OF ORCHIDS.

B. S. WILLIAMS

Has much pleasure in announcing that he has determined to make a grand show of his flowering ORCHIDS at home. The Exhibition will include, in addition to the usual stock of young Flowering Plants, all the grand specimens that he has been in the habit of including in his Collections, which have obtained the leading prizes for many years both at home and abroad.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition will contain large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LÆLIAS, ONCIDIUMS, CYPRIPEDIUMS, MASDEVALLIAS, VANDAS, AERIDES, SACCOLABIUMS, and other rare and showy ORCHIDS.

AN EARLY INSPECTION IS RESPECTFULLY INVITED.
NO CARDS TO VIEW REQUIRED.

A hearty welcome will be given to all who honour us with a visit.

CARRIAGE ROUTE.

Carriage Route from the West End is through Albany Street, Regent's Park, Park Street, Camden Town, Kentish Town, and Junction Road.
The North Metropolitan Tramway Cars, in addition to the Street Tramways Company's Cars, arrive at and start from the Nurseries, for the City and West End, every few minutes.

The Great Northern Main Line trains all stop at Holloway Station, which is within fifteen minutes' walk of the Nurseries. The Midland and Great Eastern Main Line trains all stop at Kentish Town Station, which is within ten minutes' walk of the Nurseries. The Midland, in connection with the Metropolitan Railway, runs frequent Trains during the day from all parts of London to Upper Holloway Station, which is within three minutes' walk of the Nurseries.

CAUTION.—It having come to our knowledge that some unprincipled persons have been substituting other Manures for Clay's Fertiliser, we beg to state that we guarantee the genuineness of none except in our bags, marked.—

THE
Gardeners' Chronicle.

SATURDAY, JUNE 17, 1882.

ROSE PROSPECTS.

ALTHOUGH I have lately traversed a wide extent of country, have visited many of our most celebrated Rose gardens, and conversed with many of our rosarians, and although we are now in the rosy month of June, and within a fortnight of our first exhibitions, I am as yet unable to speak positively as to the prospects of the Rose season. There are two reasons for this—one, that ever-fruital, over-frequent cause of complaint in all gardening matters—the fickleness of our climate: the other is that we are so apt to take our own standpoint and to suppose that the condition of other people's Roses is to be measured by our own; so that in asking Rose growers what is the prospect, the answer is generally determined by the aspect of their own gardens. The strangely mild winter that we passed through naturally enough led people to imagine that we must have a very early summer. Many of our spring flowers were a fortnight or more before their time, and people said we should have our great bloom of Roses over the first week in June; we were told that all Rose show fixtures were a fortnight too late, and that there would be nothing but second blooms. Many were the temptations to managers of Rose exhibitions to alter their dates, but so far the temptation has been resisted. Rose exhibitions are so many and so important that, as was experienced in a former season, changes throw everything out of gear, nor was due allowance given for the effects of that "cold wave" which for so many seasons has maulled the third week of May; it came as in duty bound, and Roses are not a whit more forward now than they were three weeks ago—the uncertainty still clings to us. I was on Saturday last with two good rosarians in a famous southern city, the day was close to a degree, the thermometer stood at 73, and my friend said, "Well, all the first blooms of Roses must be ours if this weather lasts." But it did not last; since then it has been chilly and sunless, and vegetation has made no progress. But looking at Roses as they are at present, I cannot but anticipate a favourable season. There may be, as I hear there are from some growers, swarms of aphid and attacks of maggot, although I have but little of either; mildew may destroy many a hope, although it is less likely, I fancy, with a low temperature to afflict us; drought may necessitate much watering, and yet with all possible drawbacks one may hopefully look for a good time amongst the Roses.

As to the exhibitions of the Rose, there is every prospect of much gratification to all lovers of the Rose, wherever they may be, for in all parts of the country Rose shows have sprung up, and the number increases yearly, and as a consequence the exhibitors of the Rose increase also. There is, however, a great blank to be filled up in our large shows—both of those celebrated competitors, Mr. R. G. Baker and Mr. T. Jowitt, will be absent from them, the former through a severe domestic affliction, the latter from his

having left his residence and gone to a distant part where Roses will not flourish. Those who have seen their magnificent blooms, and how far ahead they were of other competitors, may well ask—Is there any one to take their place? It may be that their absence will encourage others to come forward and make a push to take front rank—some, perhaps, whom the presence of these giants has deterred from the attempt; but without the absence of their beautifully furnished stands of Roses will form a serious drawback to our exhibitions, for it is ever well to have a high standard by which to mark our own successes or failures. There will be an anxious desire to see the new Roses, and if the opinion of competent judges may be relied upon there are likely to be some excellent additions to our gardens.

The exhibitions begin with Sittingbourne on the 23d, which will be held at Bobbing in conjunction with the assemblies of the East Kent Volunteers; Maidstone will be on the 27th, the National Rose Society will hold its first provincial show at Bath on the 28th, with every prospect of a magnificent exhibition; Farningham and Hereford come on the 30th, the Mansion House on the 30th, Horsham on the same day, the Crystal Palace and Reigate on July 1, the Grand Metropolitan Show of the National Rose Society, at the Royal Horticultural Society's Gardens at South Kensington, on the 4th; Canterbury, Oxford, and Brookham on the 6th; Sutton on the 7th, Alexandra Palace and Eltham on the 8th. In the following week the more northern and distant shows take place. Ipswich on the 11th, Cardiff on the 12th, Birkenhead on the 15th; then comes Leek, on the 18th; the National Rose Society's second provincial show on the 19th, at Darlington, &c. Thus for about three weeks the exhibitors will have a busy time of it, and manifold will be the triumphs and disappointments; and I must say that, as a rule, I know of no class of people who bear the latter better than Rose exhibitors. Where there are competent judges, surely it is unwise to make a fuss over what people may consider a wrong judgment; all men are fallible, but where rules of judging are recognised on sound principles, the probability is surely that these competent judges are more likely to be right than one over-anxious exhibitor; moreover, a couple of hours often makes a good deal of difference in the aspect of a stand of Roses, and they are often very different when the public are admitted to what they were when the judges examined them, and it is assuredly more dignified to accept their decision than to fluster oneself over a supposed injury.

Since the first lines of this were written, another proof of the uncertainty of things has occurred. I spoke of the possibility of drought interfering with the bloom. We have had since then all over the country most copious rains; aphid has met its match; and there is every prospect of a glorious Rose season. *Wild Rose.*

New Garden Plants.

ONCIDIUM MELIOSMUM, n. sp.*

A FINE *Oncidium*, whose flowers are of the richest yellow colour, with blotches of the most exquisite cinnamon. It is a pity that Dr. Lindley had already given the name *retusum*, as it might well have been given to this. The small sepals are retuse as well as the much larger petals. The basilar auricles of the lip are square, the isthmus middle-sized, and the anterior part reniform. The column is very small, of the most pallid sulphur-white, as well as the callos. I have also had a plant kindly sent over. It had originally large oblong acinapitous very shining bulbs, covered with numerous brown broken scars.

* *Oncidium meliosmum*, n. sp. (Trisetia macrostepala) pseudobulbo oblongo acinapito obscure marmorato; folio cuneato oblongo ligulato acuto; panicula ramulis abbreviatis; sepalis unguiculatis oblongis retusis; tepalibus unguiculatis subquadrate bis retusis; labelli auriculis basilaribus quadratis, isthmus aequali, paritibus antica reniformi bifida, collo depresso extrorsum multangulo, antice indentato; columna brevis bis dolabratis, mucis denticulatis; tubula infrastigmatica latissima rhomboida, fovea emarginata, basi tabule stipitata. H. G. Rehb. f.

The English grown bulbs have far less of these marks, but some are to be seen. The leaf is cuneate oblong ligulate acute. I have to thank Mr. W. Dall for this. The plant looks like a magnified *Oncidium Boothianum*. H. G. Rehb. f.

CATTLEYA (LABIATA) PERCIVILIANA, n. var.

Two merchants at a great emporium of trade having made a contract for Spanish Wheat (Trigo), had their private reasons for disliking, not so much acceptance as payment. Knowing various species of *Triticum* to be growing in Spain, they addressed to an excellent seedsman, Herr E., to decide whether the crop were of common genuine Wheat or of another species.

Herr E. looked earnestly to the seeds and mused a while as if considering the characters of species. His final dictum was "Bring me plenty of these seeds and then return next year in July. I hope to be able then to tell you what kind of Wheat you have obtained."

Oh, if we garden botanists were in the position of Herr E. I We would wait with full patience the flowering of introduced plants, there would seldom be left any doubts, and everything would be done in the most conciliatory manner, to mutual agreement.

Such is my first feeling when I sit down with twenty dried *Cattleya* flowers before me, two living plants and some notes, all sent by my indefatigable Hanseatic countryman, Mr. F. Sander. They come from some western corner of South America, where nobody has collected before. If I were Herr E. I should say, wait two years: we shall then have fresh flowers in profusion. I am not permitted to write in this way.

Whatever may be the confusion in all the names, phantasy names and nicknames, of the *Cattleya labiata* type, we must regard it as perhaps the most polymorphous and polychromic species of *Orchid*, the variations depending most probably on geographic locality, and not on soil, climate, or exposition. If a very young botanist had time and means to study a fine question, he might do grand work by travelling only for the purpose of studying *Cattleya labiata*.

Our plant is from a totally new place, yet it appears exceedingly near the eldest *Cattleya labiata* of Lindley (*Collectanea*), and of Loddiges (*Botanical Cabinet*). This might be explained by similar geological or climatic circumstances under a widely distinct longitude.

The bulbs are very strong and acinapitous, broad, with a short stipes, and three argute ribs each side. The leaf is very strong, very broad (0.18 x 0.06 m.). There are sometimes remains of two spathe, just as in the best *Cattleya labiata*, Mr. Pescatore's variety. Some specimens boast a rich hue of purple both on the bulbs as on the leaves, mostly underneath. I would like to guess this to be the consequence of a gentle exposition to the sun.

As to the flowers there is no great enjoyment to be derived from them in a dried state. There is, however, an exceptionally well-prepared lip at hand. More than the anterior half is covered by the deepest finest purple. Then there is a small pallid triangle on each side, and the remaining part shows brown stripes radiating and nearly parallel, descending towards the outer side, and interrupted by pallid lines. The interior part is finely crisp and toothletted.

So much for this plant. It may prove a source of great enjoyment. H. G. Rehb. f.

ACROCHLENE RIMANNI, n. sp.*

Mr. Kimann, who is travelling for Mr. F. Sander in tropical Asia, has just sent a very curious *Orchid* which has flowers of the finest lilac-purple, nearly equal to those of *Dendrobium Kingianum*, with a most remarkable lip of the darkest purple, having each lateral lobe semicircular and denticulate. The middle lobe is fleshy and triangular. Sepals oblong lanceolate, the lateral ones connate, bidentate at the top. The petals are short, oblong, denticulate, and make an admirable contrast from purple and blackish-purple, flowers being of clearest white (*see ?*).

Of all known *Orchids*, only *Acrochlene punctata*, Lindl., comes near it. I have, however, not been able to find the content of any author. Had it not been necessary to do so at once, I would have not named and described the plant now. I like much to give it,

* *Acrochlene Rimanni*. — Pedunculo paucifloro; bracteis lanceis acuminatis ovario pedicellato subobovatis; sepalis imparibus oblongo-ligulato acuto, sepalis lateralibus connatis supra nervos medianos subaristatis apice bidentatis; tepalibus oblongis mucis minute denticulatis; labelli basi lata, in lacinis laterales semi-ovatis; denticulatis extensis, lamina mediana carnosa linearis triangula columna gracili apice utrinque intorso undulata. Asia tropica. Rimann, H. G. Rehb. f.

at all events, a specific name in honour of its discoverer, and hope he will find many more curiosities and grand novelties. H. G. Rehb. f.

DENDROBIUM DALHOUSIANUM (Paxt.) var. ROSSIANUM.

I propose this name for a giant-flowered nankeen-coloured variety, with an exaggerated beard on the anterior part of the lip, and very few purple-brown streaks on the stems. In the flower of the genuine type, as represented by Sir J. Paxton (M. L. van Houtte) and Dr. Lindley, the sepals and petals are pale ochre-coloured, richly bordered with light purple, and there are very numerous purple-brown streaks and spots on the stem sheaths. I am sorry I cannot speak about the plant lately represented in the *Illustration Horticolæ*, the book being not at hand, and Director Linden's people having forgotten to send me an extra copy of the plate, which would have been very agreeable both to Herr Linden and to myself. The fine variety before me was sent by Mr. H. J. Ross, of Castagnolo, who may have introduced it from Birmah of Arracan. It is dedicated to this enthusiastic orchidist. L. G. Rehb. f.

PIERIS JAPONICA.*

Our illustration (fig. 120) was taken from a plant recently exhibited at the Royal Horticultural Society by Mr. Anthony Waterer. It is a hardy shrub, with rather thick dark green lanceolate leaves, and long pendulous clusters of white urceolate flowers. Of its value as an ornamental shrub there can be no doubt, though it is rarely seen in gardens; this may arise partly from the fact that the illustrations hitherto published have been very miserable representations, taken from debilitated specimens, or from plants flowering a second time in autumn, so that the true character of the plant has not been shown. The plant is a native of Japan, in the gardens of which a variegated variety with yellow marginal variegation occurs, and also a dwarf variety. The plant is not new either to science or to gardens, since it was described as long ago as 1784 by Thunberg, in his *Flora Japonica*, 181, t. 22, under the name of *Andromeda japonica*, and has been alluded to by many subsequent writers on Japanese plants, such as Miquel, Franchet, and Savatier. Maximowicz gives a careful description of it under the name of *Andromeda japonica*, in the *Mémoires Biologiques*—St. Petersburg, tom. 8, decas xii. (1872), p. 617. The name *Pieris* is here adopted because Don placed the plant in this genus, and his procedure has received the assent of Bentham and Hooker in their standard *Genera Plantarum*, M. T. M.

MAMHEAD HOUSE,

THE seat of Sir Lydstone Newman, Bart., enjoys the distinction of an almost matchless situation, overlooking that portion of the South Devon coast which includes Teignmouth, Dawlish, Starcross, and Exmouth, and a climate remarkable for its geniality and its marvellous influence upon every subject of the vegetable kingdom. Of the many approaches to this fine mansion, that from the village of Kenton, which is but 3 miles distant, and the drive to Dawlish, which is 5 miles off, are perhaps the most picturesque and delightful.

As an introduction to the natural beauties of the place, it may not be uninteresting to quote a portion of a sonnet written under an Oak at Mamhead in the year 1785:—

"Here, Laura, since our wearied feet have stray'd
From the proud obelisk that fronts the scene
Of many a tufted hill, whose border green
The sweet perspective blends in mellow shade,
While sparkling through the stately Fir trees play'd
The burnished hamlets of the vales between,
And while the misty bosom of the glade
Seemed opening to the azure sea serene—
Here, Laura, let us rest our roving eyes,
And near this ever-verdant oak repose,
For to 'unharmonized' joy prospect lies,
And dim discovered views the landscape close.
Yet clearer beauties on the lawn arise
And in full pride the shadowy foliage flows!

(If the above lines were appropriate a hundred years ago, they are even more so now, since the improve-

* *Pieris japonica* D. Don, ex DC. *Prod.*, vii. 2, p. 599. *Andromeda japonica*, Thunb., *Fl. Japonica*, 181, t. 22 (1784); Miquel, *Prodr.*, 91; *Beipage Horticolæ* (1872), 274, t. xxx.; Maximowicz, *Mémoires Biologiques*, t. 8, decas xii. (1872), p. 617; Franchet and Savatier, *Annuaire*, Pl. Japon.

ments effected in recent years have vastly enhanced the character of the landscape, rendering the scene still more alluring ; passing imperceptibly from rich green valleys and verdant hills over forests of trees clad in various shades and tints of lovely green and

all a lover of wild flowers, and can appreciate to the full the romantic scenery of the district. By the hedgerows there are Veronicas, wild Honeysuckles, yellow Broom in any quantity, and Ajugas, or the " Bugle flower " as the old wives call it in

Beech, tender and drooping, and the Hawthorns in full blow, and carpeted underneath with Ivies, how truly beautiful they look !

A stranger in Devonshire should, however, be careful to keep upon the Queen's highway. Having gone

FIG. 120.—PIERIS JAPONICA: HARDY SHRUB: FLOWERS WHITE. (SEE P. 796.)

yellow, to the golden sands of the sea-coast and the deep blue sea itself, calm and tranquil in the distance. The visitor who cares to stray through the Devonshire lanes from Dawlish to Mamhead will be more than compensated for undertaking the journey if he be at

Devonshire: one patriarchal dame indeed stoutly proclaims that she has taken " Bugle tea " for over fifty years, and has never known what it is to pay a doctor's bill ! [Poor doctors !] And the hedges, too, how lovely they are ! The young shoots of the

out of my way a little, and being attracted by an exquisite display of Wistaria upon a farmhouse such as is rarely seen, I begged permission to take a short cut through the farmyard, which was half denied by the only male occupant of the place, who evidently

regarded the stranger with suspicion. But a face attending to flowers at one of the windows nodded assent, proving once more that those who love flowers are both kind and sympathetic to strangers as well as to plants. But I must not dilate upon extraneous matters. I have reached the lodge gates, where there are a great many noble specimens of the Ilex Oak, and in a few minutes more I am hastening to discover the whereabouts of the head gardener—a task by no means unpleasant, considering the extreme beauty, size, and richness of the park, its configuration, which is so varied and pleasing to the eye, and its stock of rare trees, which are among the finest in England. At the bottom of the park there is a gate, and within this gate there is over a score of "gardeners' mouse-traps" fresh set, indicating that the gardener is not far off. Nor is he. For in another minute we are discussing upon the merits of China Roses, hardy Fuchsias, and other flowers, which are here in abundance, and have been more or less all through the winter. The walls are literally aglow with these good old-fashioned Roses, and the borders are bright with *Alonsoa Warscewiczii*, its scarlet flowers looking more brilliant than usual, because there are so few flowers approaching it in colour in the open border at this season. The hardy Fuchsias are immense bushes, growing and flowering with increased vigour notwithstanding they were cut down to the ground after the last severe winter. The fruit and kitchen gardens are in several divisions, and there is more or less of the ornamental introduced into most of them. In the largest division the borders are carefully planted with herbaceous plants, and upon the south wall there is an extensive range of Peach-houses in which there is a magnificent crop. Over 3000 fruits were gathered from this house last season, and the trees are still as fruitful and as healthy as ever. Plenty of rich feeding, and a free use of the syringe daily, by which their foliage is kept thoroughly clean, is the cause of Mr. Harper's great success in Peach growing at Mamhead. In the vinery there is a good show of Grapes, and young Vines, only a year old, are certainly highly creditable examples of Vine growing.

Mr. Harper is an "all-round" gardener, his fruit-houses are crammed with plants as well as fruits, that is, there is a plant wherever there is room for it. Pines are well grown, so are strawberries, and Melons are swelling away rapidly. Azaleas, double Petunias, Begonias, and other plants of a useful kind, are well grown either in the vineries or plant-houses, and the Camellia-house, in the centre of a range of fruit houses, contains a very good assortment of plants and some remarkable creepers, amongst them a *Polygonum*, one of the free-growing seeders, which has travelled a distance of 25 feet. In front of this structure there is an ornamental plot, a description of which will convey a general idea of the variety which characterises the place. There is a rockery in the centre of a green grass plot planted with hardy Ferns and *Salvia argentea*. A group of *Magnolia grandiflora* occupies a portion of the grass plot; they are dotted about promiscuously, and their stems are clothed with China Roses, now in flower. At the bottom of this garden there is a terrace, and beneath the terrace another garden, partly a vegetable and partly a fruit garden, which is divided by a clear running rivulet. Beyond the stream the ground rises rapidly to its boundary—an ornamental hedge, by which there is a row of dwarf Fig trees, which grow and fruit with trifling attention, certainly with little or no pruning. There is one noticeable feature in these gardens, and that is the numbers of *Glaucolili* that have established them-selves about the borders, and are never injured in the severest winters. But the unwary must not be mistaken. Mamhead, as I have before stated, enjoys a climate peculiarly its own, and a remarkable immunity from frosts. It is no doubt owing to its high altitude, natural shelter, and free open soil, that plants survive the winter at Mamhead when they are killed but a few miles off, say 4 or 5 miles as the crow flies. Berding plants very often stand out the whole winter.

The walk through the park to the house will be found unusually interesting to the lover of trees, especially if he take a *déjeuner* to the left by way of the church. One of the Ilex Oaks, for which the park is famous, is over 21 feet in circumference; here also is the largest Cork tree in England, which measures 19 feet in girth at a foot from the ground. The margin of the wood facing the church is brightened up with flowering Chestnuts and other trees now at their

best, which are well intermixed, and are very effective at a distance. If you have a fine Pine at the back of a flowering Chestnut, or *vice versa*, and one is a little taller than the other, and if there is a drooping *Laburnum* in the front and a fine Hawthorn not far off, or a group of them, these are objects that no one will fail to look at during the present month. But I must not dwell at too great length here, for in the churchyard, a few yards distant, there is an extraordinary specimen of the English Yew, which claims respectful notice. It is 3½ feet in circumference at 1 foot from its base, and at about 3 or 4 feet from the ground it has fourteen limbs radiating from the outside of the trunk, leaving a cavity in the centre sufficiently large to accommodate a tea party on a hot summer afternoon. I climbed the tree to see for myself, so I am not overstating the case. It is a huge tree, as pretty in appearance as it is wonderful in size. Between the church and the mansion on the left of the carriage-drive is the remains of the Cedar grove, which was severely injured by a hurricane some years ago, and which still contains many good specimens.

The private grounds are entered by a gate from this side, and the slopes and terraces by which the mansion is completely surrounded are of the most lovely and picturesque description. The flower garden is upon the south side, and consists of four large oblong plots in grass with bold figures in their centres and scrollwork round the margin of the grass. There is a massive fountain in the centre of this group. The next group of figures are laid out in Box, triangular in shape, with the points of the triangles surrounding a sun-dial. Upon the bank overlooking this garden the plants of *Rhododendrons* of various colours, and *Ghent Azaleas* intermixed with *Lilacs*, *Laburnums*, *Prinotia serrata*, and *Magnolias*, are truly beautiful. One tree of *Magnolia* in flower, overhanging by an evergreen Oak, and having a large clump of scarlet *Rhododendrons* for a near neighbour, is particularly lovely. Upon the west side a green slope dotted with trees, and laced round by a thick plantation of Beech, Elms, Chestnuts, &c., and having a dense background of Scotch Firs, have a grand effect in the twilight. The first evening star is peeping through the tops of the dark green Firs, the grass slopes are bathed with silvery dewdrops, and the steep terraces upon the east of the mansion are clothed in sombre green, and grey and red dyes; there are leaves here of such exquisite colour, and of so many various shades, that one almost forgets to notice the stately mansion and the statuary by which it is surrounded. The conservatory is of course in keeping with the architectural style of the mansion, and is filled with very fine healthy *Camellias*, *Palms* in rustic tubs, Ferns, and other suitable plants.

As will be gathered from the foregoing remarks, the carriage front is upon the north side of the house. There is a large circle in grass here, and a broad clump of *Rhododendrons* in its centre. The western boundary is composed of a bank of *Cotoneasters*, hardy *Geans*, and *Escallonias*, lit up with patches of yellow Gorse and the blue *Vincetoxicum*. Beyond the confines of the circle there are noble specimens of the Douglas Fir, *Pinus excelsa*, and stately Cedars; but to do justice to this fine place one might write a book, so I am obliged to bring my remarks to a close somewhat abruptly, not however, before I bear testimony to the industry and energy of Mr. Harper, whose heart is in his work, and who conducts the management of this fine place so creditably and successfully that it is not only interesting but also instructive to visit the garden and converse with the gardener-in-chief. *Devonian*.

THE EXETER NURSERY.

(Continued from p. 796.)

In describing the stock of such a nursery as this it is hard by justice to bestow a word of praise—cultural praise I mean—upon those magnificent specimens which up to a very recent period have been exhibited in various parts of the country. Where there is an *Ixora*-house, a *Croton*-house, an *Anthurium* house, and a *Nepenthes*-house, the ordinary reader will understand by it as representing ordinary stock; but in this instance it is very much more, for many of the plants, especially the *Crotons*, are giants in size, and as perfect specimens as can be found anywhere, and this without making any exception that the writer is aware of. The *Ixora* house is furnished with fine plants breaking away vigorously, many of them

in an advanced state, and having for their companions a few other heat-loving subjects. In the *Nepenthes* house the stock is clean and healthy, such varieties as *Rafflesiana* and *Hookeri* being the most noteworthy. There is no stage in the *Croton*-house, the plants are set upon inverted pots, and every plant is within a few inches of the glass. The largest specimens of *interruptum*, *Johannis*, *Disraeli*, and *undulatus* are 6 feet by 6, and as well coloured as if it was the month of August. Of course they are other varieties in abundance of such kinds as *Earl Derby*, *Macarthurii*, *volutus*, and a stock of *Dipladenias* in very fine trim, which appear to be grown for no ordinary purpose. The collection of *Anthuriums* have been weeded or cleared of all doubtful or spurious varieties, and only those retained that are up to the acknowledged standard of the day in quality. Some of the plants are as much as 4 feet across, and bearing as many as forty fully expanded spathes. Still among the specimens the visitor will find in the "new stove" a very fine collection of *Allamandas*, including *Hendersonii*, *nobilis*, *grandiflora*, and *Cheloni*; also *Medinilla magnifica*, *Stephanotis floribunda*, and a good assortment of stove stock generally. There are two houses filled with *Eucharis amazonica*, several houses of young Vines, and propagating-houses, besides pits and frames filled with bedding-plants, and other nursery stock in variety.

Peach growing is carried on in a lofty range, where trees are trained against a back wall, and large numbers are grown in pots. Grapes are grown in a house 100 feet long, in which the merits of new kinds are tested, and other fruits are grown in greater or less numbers. Leaving the glass department for a tour through the grounds I noticed the Golden Ivy, *Mrs. Pollock*, beautifully coloured, against a wall, and another variety, *atropurpurea*, with the old leaves nearly black, and the young ones a delicate green, growing out a couple of inches from the wall. This variety is worthy the notice of planters. By the main walk of the nursery will be found some unique specimens of the Conifer family and other trees and shrubs. Here are weeping *Hollies*, *Cupressus*, Cedars, *Thuja gigantea*, *Picea amabilis*, the Golden Yew, *Taxus elegantissima*, golden-topped Irish Yews, *Podocarpus chinensis*, the Chinese Yew, and *Biota japonica elegantissima*. The admixture of flowering shrubs has a cheerful effect at this season, or a little earlier when such flowering trees as the lovely *Yrusulus floribunda* are in full blow, and *Mabonias* and *Berberis*. Some remarkable specimens of *Quercus Fordii*, the finest of all the evergreen Oaks, are pointed out, and they are in very truth model samples of their kind.

The variety, form, and colour of so many elegant shrubs and trees grown under such favourable conditions, make a display taken as a whole, and afford instructive lessons to intending planters, which will well repay the trouble of a visit to any one interested in the planting, arrangement, and cultivation of the plants and trees enumerated above. But I have not yet got half through the list of choice things that struck me as being of especial merit. As a bush for a shrubby border, perhaps the beautiful *Eleagnus austro-marginatus* is not surpassed. It goes well against any of the green *Thuyas* or *Cupressus* or *Abies*. Of the latter there are large specimens of *lasiocarpa* and *nobilis*, common English Yews (*trained*), *Cryptomeria elegans*, *Retinospora filifera*, *pumila*, *aurea*, and *squarrosa*; *Biota pendula*, *Pinus Jeffreyi*, *Abies grandis*, *P. cilicica*, *Cedrus atlantica*, and a fine bush of *Cotoneaster affinis*. Threading my way through many broad acres of fruit trees of all kinds—Apples upon the free and Paradise stocks, Pears as standards and dwarfs, and hosts of other fruit trees, in plots, separated by tall Beech hedges—I am again surrounded by a wealth of choice trees and shrubs of infinite variety, sizes, and forms. Amongst them are *Cephalotaxus Fortunei* and *drupacea*, *Taxus adpressa* and *T. adpressa stricta*, a pair of unique specimens of *Wellingtonia gigantea*, *Abies Kämpferi*, the golden Larch, *Araucarias* feathered to the ground, said to be the finest in the country, and a unique specimen of *Thuyopsis borealis*. *Thuja occidentalis Verbeemiana* is also extra fine, and so is *Picea polia*.

These are a few of the most noteworthy specimens, and I will now pass on to everybody's favourites in the herbaceous and alpine grounds, which are furnished with Pinks, Carnations, Delphiniums, Phloxes, Pansies, *Pyrethrums*, *Sedums*, double Wallflowers, *Funkias*, *Penstemons*, *Myosotis*, *Dodecatheon Meadia*,

the American Cowslip, *Primula amoena*, Iris (both German and Spanish), *Achillea umbellata*, *Primula platypetala*, Saunders' dark Wallflower, a very striking variety for borders; *Lithospermum prostratum*, and a famous collection of *Chrysanthemums*. In a nursery of 100 acres one cannot more than refer to the most conspicuous features, and I have therefore omitted allusion to the beautiful "rock garden" to the last. It is a standing monument to the skill and ability of the late Mr. Pince, and there are far too few of such gardens throughout the country, I suppose for the simple reason that people do not know how to set about making them. Be that as it may, the rock garden in the Exeter Nursery is a model work of its kind, that will stand the scrutiny and criticism of generations to come, so elegantly is the work designed and executed. There is something substantial about its appearance, because the designer has not attempted to put Nature in the shade, but to imitate her. The walks through the garden are in strict harmony and proportion to its formation and extent, and the planting arrangements have also been conceived with consummate taste and judgment. Specimen Ferns and Ivies overhang or creep over the rocks, some of which are of immense size, and are so disposed that there is space to grow plants which furnish an appearance at once massive and striking. There are good specimens of *Cupressus Lambertiana*, *Picea excelsa* in-verta, sometimes called *monstrosa*, planted at certain points, and these are supplemented with *Viburnum plicatum*, Bamboos of sorts, and *Torreya mystica*. *Skimmia japonica* also succeeds well, perhaps under it there is a glowing patch of *Saxifraga granulata* or other alpine or rock plants, equally pretty and interesting. The evergreen Beech furnishes a canopy of foliage in summer, and Mahonias and Berberis are in present gay in yellow and orange. In short, the planting is so arranged that go when you will the "rock garden" will always be found furnished with plants and flowers in season, and will probably be remembered when the big specimen plants, Ferns, and Orchids are well-nigh forgotten.

COLONIAL NOTES.

HONG KONG.—From Mr. Ford's report on the Hong Kong Botanic Garden, we learn that the following trees were planted during the year:—

<i>Pinus sinensis</i> , two-year-old plants	144	943
" " size from a foot to 10 feet high		382
" " sown <i>in situ</i>		60,555
<i>Aletris triloba</i> (Candleberry tree)		45
" " sown <i>in situ</i>		1,990
<i>Eucalyptus</i> spp. (Gum trees)		1,537
<i>Cupressus torulosa</i> (Distrib. Cypress)		74
Bamboos		48
<i>Quercus vilcinia</i>		59
" " Hartland		61
<i>Pinus retusa</i> (Banian)		10
" " large trees transplanted		10
<i>Pinus canariensis</i> (Canary Island Pine)		23
<i>Cupressus funebris</i> (Funereal Cypress)		26
<i>Synephea laurifolia</i> (Turpentine tree)		14
<i>Grevillea robusta</i> (Silky Oak)		22
<i>Dammara robusta</i>		21
<i>Stillingia sebifera</i> (Tallow tree)		25
<i>Albizia Lebbek</i>		31
Miscellaneous		23
	211,013	

About seven years ago an experiment was made of sowing seeds of *Pinus sinensis in situ*—that is, small plants, each about a foot square, were dug and levelled on the hill-side where it was intended trees should grow, and on these sites a few seeds were sown. The trees on the plots of ground thus treated succeeded so well, and finding also that the trees reared by the villagers on Chinese territory and on this island had been thus reared, I was induced to prepare and sow 60,000 sites in the same manner. The seedlings on these sites having given sufficient promise of succeeding, a much larger area—viz., nearly 600 acres, containing about 650,000 sites—was selected for this mode of afforestation during 1881. Although the trees reared *in situ* do not grow so vigorously for the first few years as those reared in, and transplanted from, nurseries, still the method has much to recommend it. Taking it for granted that the same amount voted for afforestation during this year will be granted annually until the wooding of the island is completed, we shall be able to accomplish this desirable object in a quarter of the time, by sowing *in situ*, of that necessary under the nursery system. When the trees are large enough to fell for firewood, &c., a financial return for the outlay expended upon them can, it is hoped, be obtained by judicious periodical thinning and felling of portions of the plantations.

LIST OF GARDEN ORCHIDS.

- DEMERORIUM.—(Concluded from p. 775)
- 242. D. *PTILORUM*, Lindl., *Gen. and Sp. Orch.*, p. 77. *Demetrium trilobum*, Blume, *Bijdr. tot Fl. Nederl. Ind.*, p. 331.—Java. Cultivated in the Botanic Garden, Buitenzorg.
 - 243. D. *UNDULATUM*, R. Br., *Prodr. Fl. Nov. Holl.*, p. 332; Benth, *Fl. Austral.*, vi., p. 278. *D. distictum*, Lindl., *Bot. Beech* 1841, t. 52; *Gard. Chron.*, 1841, pt. 279, 687.—Australia, various localities in Queensland. Messrs. Loddiges obtained it in 1838, as was supposed, from Java; but we have no other evidence that it occurs elsewhere than in Queensland. Flowers a mixture of yellow and brown, borne in loose racemes, terminating the leafy stems; remarkable for their curled wavy sepals and petals. Hort. Kew.
 - 244. D. *UNGUICULATUM*, Teijsm. et Binnend., *Nederl. Tijdschr. Ned. Ind.*, p. 259; Miq., *Fl. Nederl. Ind.*, iii., p. 634.—Java. Buitenzorg Botanic Garden, 1866. Inconspicuous.
 - 245. D. *UNIFLORUM*, Teijsm. et Binnend., *Nat. Tijdschr. Ned. Ind.*, xiv., reprint, p. 9.—Sumatra. Buitenzorg Botanic Garden, 1866. Inconspicuous.
 - D. *VEITCHIANUM* = D. *macrophyllum*.
 - 246. D. *VENUSTUM*, Teijsm. et Binnend., *Nat. Tijdschr. Ned. Ind.*, xiv., reprint, p. 4.—Siam. Buitenzorg Botanic Garden, 1865. Flowers greenish-yellow.
 - 247. D. *VIRGATUM*, Linden, Planch., *Hort. Donat.*—Cultivated in the garden of Prince Demidoff at San Donato.
 - D. *VILLOSUM*, Wallich = D. *Jerdonianum*.
 - 248. D. (*PELOIDUM*) *VIRIDIOSUM*, Rehb. l., *Bon. Tijdschr. Ned. Ind.*, xxiv., p. 225; *Idem*, vi., p. 225.—Java or Amboyna? Imported and cultivated by Consul Schiller, Hamburg, about 1835. Allied to *D. secundum*. Flowers rose, tipped with green.
 - D. *VALLICHI*, Hort. = D. *nobile*, ex Planch., *Hort. Donat.*
 - D. *WARDIANUM* = D. *Falconeri* var.
 - 249. D. *WILLIAMSIANUM*, Rehb. l., *Gard. Chron.*, n.s., ix., p. 652.—New Guinea. Introduced by Mr. Goldie for Mr. B. S. Williams. Described as a very fine species, but the colours were not fully known.
 - 250. D. (*NIERO-HIRSUTA*) *WILLIAMSONI*, Day and Rehb. l., *Gard. Chron.*, 1860, p. 78.—Assam, India. Sent by Mr. W. J. Williamson to his uncle, Mr. Day. Flowers similar to those of *D. Draconis*, with some light brown, and a large 3-lobed blood-red spot on the lip.
 - 251. D. *XANTHOPHILUM*, Lindl., *Gard. Chron.*, 1857, p. 268.—India. Imported by Messrs. Veitch. Near *D. longicornis*, having rather small whitish flowers with orange-coloured veins on the lip.

W. R. H.

(To be continued.)

HARDY PLANTS AT EDGE.

Geranium arvense comes up year after year without any visible increase. It grows 2 feet high, with large soft Geranium-like leaves, and large rich dark crimson flowers, resembling those of the old crimson *Petunia*, but smaller. It is decidedly handsome, and requires no cultivation.

G. eriostemon, given to me last autumn by Mr. Bowman from his beautiful garden in Surrey. The flowers resemble those of *G. pratense*, but are larger, earlier, and of a richer blue; the habit of the plant is much dwarfer, and the flowers in far greater number in proportion to the leaves. It seems a great acquisition. I plant all the *Geraniums* in full sun, as their tendency in this wet soil is to become too leafy.

Campanula barbata.—Two packets of seed, one of the blue and the other of the white variety, from Mr. W. Thompson, of Ipswich, in the spring of last year, gave me several hundred plants of each variety, and the colour seems to come true. They are now coming into flower. I recommend the plant to every one with a garden, large or small: no position or treatment seems to offend it, and it may be lifted with a trowel and inserted in any gap up to flowering time. The plants are from a foot to 18 inches high, with leafless stalks bending over at the top and bearing on the curve several elegant drooping bells, 1½ inch long, very open at the mouth, which is conspicuously bearded. Some of the larger plants have five or six flower-stalks. The white of the flowers is very pure and the blue clear and good.

C. nobilis.—This rambling subject, which is apt to throw up flower-stalks anywhere but where it is planted, answers very well, as do other plants of similar habit, when confined in an earthenware hoop 9 inches in diameter, inserted with the upper rim level with the surface of the ground; a plant of the white variety imprisoned in this way last autumn

has now ten spikes 1 foot high covered with long showy bells.

C. glomerata.—Under this name I include several which may be botanically distinct, but from a gardener's point of view are all one. I mention the plant to tell gardeners that it may be cultivated to 3 or even 4 feet high, with large round showy clusters of flowers of rich purple, or light lavender, or white, though the latter variety does not grow so large. Frequent division and rich soil are required.

Ononis rotundifolia.—This very pretty plant, with its abundant Vetch-like flowers, of a clear rose colour, requires a well drained border. It is one of those plants which become shrubby and very brittle where the stems join the single root-stock, and so requires shelter, or tying at the base. Such plants are seldom long-lived, and it is best to keep up a succession from seed, which never ripens here. I find young shoots, though covered with buds, will strike with patience.

Veronica leucurum.—What I have as the type of this very variable species is the best of the genus now in flower; the blue of the flowers, which are produced in long axillary spikes, is very bright and clear. It grows from 1 foot to 2 feet high, according to situation; shade spoils the colour, and chalk or lime improves it; it becomes too leafy in a heavy wet soil. All these *Veronics* should be divided every other year, but not all the plants in the same year, as they are finest the second year after division.

Genm intermedium is thought to be a hybrid between *G. urbanum* and *G. rivale*, being found wild where both these native plants occur; as a garden plant it is far superior to either of its parents, having a longer flowering period, and flowers more open than those of *G. rivale*, and of a bright yellow. It is at home in a damp half-shady corner, where it requires no care when once planted. The side of a stream or tank would suit it well.

Minulus cupressus.—This brilliant little gem is seldom seen, being quite distinct from what is often sold for it. It does not grow more than 3 or 4 inches high, and its large flowers are of the brightest copper colour, approaching to scarlet. It is probably easily lost by either drought or severe frost; at least, a friend in Devonshire who gave it me lost it in the winter of 1880, and got it from me again. It is one of the plants of which I always keep a pair in winter in a frame, and a square inch of it planted in April at the base of a well watered rockery becomes a square foot by the end of June, and attracts great admiration.

Antirrhinum lilastrium succeeds best at the base of a rockery with a western aspect, where it gets shelter, partial shade and moisture. This is a plant of which it would be difficult to have too much; it increases slowly, and I never lose an opportunity of buying a cheap lot of it.

Aquilegia Bartolini, sent to me by Mr. W. Thompson, of Ipswich, in autumn, is one of the very few really distinct-looking *Aquilegias* amongst many new names. It has a very elegant spreading habit, grows about 15 inches high, and has flowers with widely extended pointed sepals of clear bluish-purple and twice as long as the cream-coloured corolla; the spurs are bent and cross one another.

It is just a month since my last notice of rockery plants was sent to the *Gardeners' Chronicle*; only a few of the plants now in flower can be described, and those are selected which are either especially good or are little known. Some of them would grow nearly as well on level borders in open well-drained soils, but here I am obliged to treat nearly all choice plants as alpine.

Onoma tauricum is flowering freely on a dry upper ledge in sandy soil; this plant is hard to keep through the winter, owing to its dislike of damp, but if it retains any life at all till spring it quickly recovers. Two out of three plants here died, and cuttings made, though not hard to strike, are as hard as the old plants to keep through winter, even under cover.

Catharrha villosa bears considerable resemblance to *Meconopsis nepalensis*, but has its flower-stalks more branched, and the flower, with four petals, is intermediate in size and form between *M. nepalensis* and *M. cambrica*. My plant came in the spring of last year from Ware, of Tottenham.

Cerinth alpine, said to be the only perennial of the genus in cultivation, has a pendulous habit, with green and purple flowers. I obtained it last year from Frebel, of Zurich.

Cyananthus lobatus is a well-known gem for a moist sheltered corner or hollow on the rockery. It is difficult either to divide or to transplant; but when established seems perfectly hardy and easy to keep. It is increased by taking off the first shoots in spring when 2 inches long. The flowers resemble those of the blue Periwinkle.

Lycnis Lagasce does best when treated as a biennial. Even it quite hardy against cold, it certainly cannot bear violent alternations of snow, rain, and frost, as it is not a true herbaceous plant, but a soft-stalked shrub. It is better to pot off the seedlings in autumn, and keep them where they can be sheltered from rain and snow, and plant them out late in April. This is a little trouble, but the brilliant little heaps of dark pink which last all through May and June quite repay me. It ripens seed in abundance.

Linaria origanifolia, a half-shrubby species, perfectly hardy and easy to keep, and producing seedlings all round it, has flowers larger than those of the common Ivy-leaved Toad-flax, and of nearly the same shape and colour. In June the plant is very pretty, but later it becomes straggling, and looks better when cut back. It is the most free-flowering of all the Linarias.

L. hepaticifolia, also called *pilosa*, is very close-growing, like a very dwarf and compact form of *L. cymbalaria*. It is well suited for covering the angles of steps or other spots amongst stones, where it will not get overgrown.

L. pallida, sold by Messrs. Backhouse as *L. cymbalaria maxima*, is well worth the room it takes, but it should not be planted amongst choice dwarf alpine, as it runs underground insidiously, and appears in the middle of them, but is easily pulled up. It is better to assign a well-defined space, say a square yard, to it, and to keep it to its place.

L. alpina.—It is usual to recommend that this beautiful and elegant alpine should be allowed to come up from seed where it likes; but in this climate, unless the plant rests on rock, it damps-off in winter. I find it far better to collect the seed, which is ripened in profusion, and sow it in pans, and plant it out in bunches in autumn in suitable spots, reserving a panful in a cold frame for filling up vacant spots in spring. If so treated there is not a more useful rockery plant, as it never spreads far.

Helianthemum.—Besides the endless though beautiful varieties of *H. vulgare*, which are provoking by overgrowing their neighbours, I have two other natives of far more manageable dimensions, both exceedingly free-flowering. They are *H. polifolium*, pure white, from Devonshire, and *H. canum*, bright yellow, from Llandudno, both admirable plants in dry sunny positions when resting on rocks—a most important point with a large proportion of alpine in a damp climate like this.

Dianthus alpinus is decidedly best when grown from seed, and the same may be said of all the Dianthi, and of nearly all alpine; but there are two difficulties, first, to get the seed, which is seldom offered for sale in England; and secondly, to make it grow. However, I raised a fair stock of *D. alpinus* in the spring of last year from W. Thompson's seed, and some of the plants are now bearing a dozen flowers. Nearly all the alpine Pinks require deep sandy soil in exposed sunny level spots amongst the rocks. *D. exissus*, *D. neglectus*, *D. cruentus*, *D. petraeus*, and many others are now in flower, and my advice to those who have rockeries is to grow as many varieties as they can get, as there are few prettier rock plants.

Aphyllanthes monspessulana.—Patience is always a virtue, but especially with this plant, which I planted in the spring of 1880. It has ever since been in constant danger of being pulled up as a seedling of the common Rash, of which there are too many in this garden; but this spring it grew, and is now flowering well.

Delphinium nudicaule flowers freely on the rockery, and is of a brilliant scarlet, but it evidently likes moisture, for it is flowering equally well in a bog bed where I planted it last autumn. I raise it from seed which I save at home. It sown early the plants flower late the first year, and early, but continuously, the second and third. However, its duration of life is not long, the tuberos root seeming to find difficulty in breaking into growth after two years old, though it continues to live for some time without energy.

Orobus formosus rotensis is a plant of which I do not know the history; but I bought a packet of seed

from Mr. Thompson two years ago, and raised only one plant, which is now in flower. It is about 6 inches high, very bushy, with stiff leaves, reminding me of a *Thalictrum*, and flowers of the size of *Orobus vernus*, of a uniform rosy-crimson: it well deserves its second name.

Astragalus.—A collection of this genus is a very large order in more ways than one, and those who intend to grow them must be careful to know the dimensions of each, and to put it in its right place. Having grown them indiscriminately from seed, I found that *A. alpeuroides* grew upwards like *Jack's* beanstalk in the fairy tale, and was useless for ornament. *A. galeiformis*, though 4 feet high, is a very elegant and well formed plant, well worth a place where there is room for it, but not on a rockery; *A. hypoglottis* and *A. h. alba*, on the other hand, rise hardly an inch from the ground, and are really good rockery plants; but the best are *A. vaginatus* and *A. monopessulans*, especially the former, which produces in abundance large flower-heads of deep rich purple, but being of procumbent habit they must be planted so that the flowers do not drabble on the ground, and the edge of a ledge where they can hang over the rock is the place for them. Others highly recommended are *A. pannosus* and *A. assurgens*, both of which I raised last year from seed, and they are now in flower, but I do not think they are likely to supersede those mentioned just before them.

Viola montana, with large flowers of pale blue,

FIG. 121.—DIAGRAM OF ORDINARY TRAINED CHERRY TREE ON WALL.

forming a neat bush from 9 inches to a foot high, and flowering through June, is good and distinct.

Stachys corsica, growing quite close over the rock, with abundance of pure white *Salvia*-like flowers, with a most curious irregular outline, is well worth growing, and is one of many things of which I keep some in reserve pans, as it has the character of not being very hardy. These reserve pans of alpine are of the greatest use in keeping up one's stock of rockery plants. In September or October a few seed-pans, a foot square and 4 inches deep, are filled with doubtful subjects of this sort—often two or three kinds in a pan—and are kept exposed all winter, except in rain or snow or very severe frost, when a light is drawn over them. Any old boards fastened to posts make the frame, and the pots stand on sand or coalsashes. Beware of the turf frames sometimes recommended, which harbour slugs and vermin without end.

For the purest white, *Silene alpestris* is now unsurpassed, and for abundance of flowers, lasting from spring to autumn, those who admire a bush of Daisies should grow *Erigon mucronatum*, formerly called *Vittadenia triloba*. It will bear cutting and clipping into any shape, and still flower as freely as ever, and is a great favourite here. Any piece will root, and it grows readily from seed.

Lastly, for an annual to flower in bare sunny spots through June and July, *Leptosiphon hybridus*, which has now been waiting a week to see the sun in order to open its flowers, is never out of place in the choicest parts of a rockery, at least in those parts of the kingdom which are blest with sun. *C. Walley* Do!, *Edge Hall, Malpas, June 9.*

TO PRUNE, OR NOT TO PRUNE?

THERE can be no doubt the time, mode, and extent of pruning have often been made too much matters of mere routine. We have pruned because we were taught to do so, or because our fathers did so, or better reason still, inasmuch as our past prunings have proved tolerably successful. Now it is shown that neither of these can be held to be very valid reasons why we should continue to prune, for the necessity and extent of pruning must ever be largely dependent on such physical and other conditions as site, soil, climate, constitution, age of plants, desired form, area to be occupied, &c. Now as few of these conditions seldom or ever repeat themselves, it follows that our methods of pruning must be widely varied as the conditions, if they are to prove efficient. A grave and more vital question often needs to be asked and answered, viz., whether any pruning at all is needed? We have, most of us, been too much in the habit of taking the latter for granted, forgetting, apparently, in our haste to better Nature's instructions and practice, that she knows nothing of the knife, and yet trees left wholly to the moulding and management of Nature are by no means lacking in beauty of form or profuse fertility.

True it may be retorted that Nature has at least a twofold set of severe and at times savage pruners. Ruminant animals browse on the tops, and the crowded struggle for room and life in the soil, crowd out, eventually cut off, many roots from their supplies

of food. Still fruit or other trees are often planted in favourable conditions as to soil, site, and area, and these, left to Nature afterwards, not seldom rival in form and fertility those pruned on the most scientific principles.

It has been said, indeed, that the first lessons in pruning were given by a donkey, and it must, we fear, be admitted that in no department of horticulture can so many true successes of this long-lived and long-earned quadruped be found as in its many pruners past and present.

However, a great change for the better has come over this department of horticulture within the last few years; growers of fruit generally prune less than they did, and gather more fruit in consequence. The old barbarous practice of hacking off the heads of trees has given place to improved methods of moulding growth, not only into form, but also into fertility. Hence walls are now covered with flourishing fruit trees in less time than it took to start a few horizontal or leading branches in the olden time. One of the maxims of pruning and training—and it is one that holds good for all time—was, Form the base lines of your trees well, and the upper portions will furnish themselves. True, most true, if no pruner with his sharp knife prevents them, as has so often happened, to the weakening of the tree, the forcible restriction of its size, and the serious loss of time and produce. Close planting is doubtless chargeable with a great deal of the slashings and cuttings of fruit trees in gardens. The object in many cases seems to be how to get as many trees as possible on to a given space rather than the reaping of the heaviest crops from a given area. The general

testimony of experience, however, seems to show that more fruit may be gathered from a few large trees left very much to Nature than from many small ones over-pruned.

As an illustration in point, I enclose diagrammatic sketches of two Cherry trees on walls, one pruned and trained in the usual way (fig. 121), the other simply backed up against a wall, and not pruned (fig. 122). Both are the same age, planted in the same soil, at the same time; they are also growing against or on the same wall—so that as near as can be the physical conditions are identical. What difference there is against the larger tree, for it is near to a door that is often open, and which creates a sharp draught. As to the relative yield of the two trees, it is no exaggeration to say that the full grown Cherry gives pecks of fruit to the other's pints; the quality and size are well-nigh equal, and this extraordinary fertility continues year after year. There may be objections to treating all trees in a similar manner in our climate. Further removed

state of freedom after a course of severe pruning and training on and off walls, are sufficient to show that Mr. Hudson's practice is likely to prove successful. That, however, by no means shows that pruning is likely to become an obsolete practice. In case of wall trees it may be needful to prune for form, to limit their area, and to keep them close to the wall, thus to obtain a better climate and more warmth. Peaches and Nectarines will generally need pruning in the open air for the above reasons.

As I cultivate cordons, and not a few pyramidal Pear and Apple trees, some may retort that I hardly practise what I preach. But the inconsistency, if any, is more apparent than real. Few cultivators can prune less; the secret of quickly fruitful cordons, even, I consider to be the masterly inactivity of giving them their heads, and leaving them entirely alone. They are never cut back, but laid in full length as maidens, and the results have been most satisfactory. The pyramids have any excessive growth checked by

Orchid Notes and Cleanings.

WORK IN THE HOUSES.—By this time the greater part of the *Odontoglossums* will have passed through the flowering stage, and those that have not been weakened in the process ought now to be starting away again freely. Any plants that are slow to move, and show a disposition to take a short rest, should be watered a little less freely than those that show by their free growth that their roots are active and healthy. The "breaking" season of the plants is always an interesting one, as the practised eye quickly discerns whether the plants will improve on their present condition, or go in a retrograde direction. Any plants in small pots that show a disposition to make growths out of proportion to the size of pot they occupy may be safely transferred to pots one size larger, but in carrying out the operation of potting at this season the plants ought not to have their roots disturbed, but should be transferred with their ball of roots entire. If the plants are in the condition they ought to be—with a mass of healthy roots coiling round the old ball of soil—they will take hold of the new compost at once, and the new growth will soon show the benefit of receiving nutriment from the fresh compost. Most plants, whether deciduous or evergreen, prefer a moister atmosphere when commencing new growth than at other seasons, and the *Odontoglossums* are no exception to the rule, as a dry atmosphere continued for any length of time or even intermittently will tell seriously against the full development of the now advancing growths. Any plants that have been removed from the cool house while in flower should at once be returned when their beauty is over. One of the best summer-flowering cool Orchids is *Epidendrum vitellium*, and where a good stock of plants exists a long succession of blossom may be had, as it will bear being gently forced without injury. It is one of the brightest and most lasting Orchids we have. The *Phalenopsis* will now be on the move, and a night temperature of 70° must be maintained, and the day temperature should range from 75° to 90°, according to the state of the weather. When once growth has commenced they should never be allowed to suffer for want of moisture at the root, as drought would tell seriously against the full development of the foliage. It sometimes happens that with the first flush of growth flower-spikes will also appear, but if the plants are expected to make the most of the growing season these should be removed as soon as they are seen, as it is too much to expect to have good growths and a crop of flowers on these plants simultaneously; and if the strength of the plants is reserved they will give much greater satisfaction when their natural season for flowering arrives. With the temperatures given above a very humid atmosphere should be kept up, and the evaporating pans on the pipes may be filled with liquid manure, or a handful of soot may be put into the pans occasionally, which will assist in keeping the atmosphere in a condition agreeable to these plants, and, indeed, the whole of the plants, of whatever genus, in the East Indian-house. The *Stanhopes* should now be occasionally sponged over to keep them free from red-spider. The material round their roots should be kept moderately moist while they are developing their spikes, and any that require it may be rebasketed soon after flowering is over. *Sobralia macrantha*, when well grown, and the plant kept dwarf, is one of the finest summer Orchids. As soon as the plants go out of flower, or before, if the new growths are starting, they should be repotted in rough fibrous peat. It likes a liberal root-run, and will stand feeding with liquid manure. This is sometimes given the heat of the East India-house, but the temperature of the Cattleya-house is most suitable, as the growths get better ripened, and the plant flowers more freely. *J. Roberts, Gammersbury.*

FIG. 122.—DIAGRAM OF FREE-GROWN CHERRY TREE AGAINST A WALL.

from the wall, their local atmosphere would be colder. And yet, singularly enough, the Fig, which perhaps needs more heat to ripen it than any other fruit we grow in the open air, thrives and fruits well backed up against a south wall, and allowed to grow without pruning. One of the finest Apricot trees ever grown by the writer was allowed to run semi-wild in the same manner. It was planted on the lofty gable end of a stable and hay-loft; the roof projected over the end wall 18 inches. The Apricot was allowed to grow as a half-standard, and the yield was prodigious—in fact, more from the single tree than from a whole Apricot wall besides in a garden where Apricots did well.

Last year, too, the writer visited the Peach-house of an amateur where little or no pruning had been indulged in. The young shoots were literally bent down with their burdens of foe Peaches, as closely packed together as ropes of Onions, and the crop finished well, and the same trees promise to repeat themselves this season.

These examples, as well as others which might be cited of Apples and Pears being allowed to run into a

root pruning and summer pinching once in July—so that little or no winter pruning is necessary. With larger trees in fruit quarters they are allowed their heads, as Mr. Hudson has done with his two Pears. We have found, however, the *Bon Chrétien* needs more than its head to make it fertile, that is, root-lifting or pruning.

I also heartily endorse the editorial view, that as our prunings become more scientific they will become more special, till almost each variety of fruit tree will be subject to much, little, or no pruning, as its habit and constitution may require. What would be thought of the surgeon who treated all his patients in the same manner, and subjected all to the same operations? Almost equally pedantic, cruel, and mischievous is the horticulturist who prunes all trees alike, no matter what physical differences may surround them, and what constitutional peculiarities may exist among them. *D. T. Fish.*

CARTER'S FAIRY QUEEN VIRGINIAN STOCK proves to be a very desirable acquisition at Chiswick, where it is now in full bloom. The flowers are light rose, or rose-pink, and are produced with remarkable freedom. It is quite a gem.

CATLEYA GIGAS.—Sir Trevor Lawrence's grand specimen of this fine Orchid is now flowering at Burford Lodge, and bearing the splendid total of five dozen and two blossoms. Sir Trevor has also a magnificent variety in bloom which is distinguished by the name of *Burfordensis*, and which is much larger in all its parts than the type, with an even more highly coloured lip. It was shown at Kensington on Tuesday. A fine plant of a beautiful dark

variety is also blooming with Mr. B. S. Williams. This form has rosy-lilac sepals and petals, with two yellow eyes. The plant has two spikes. *C. gigas* is generally supposed to be a shy flowering species, but both Mr. Spyers and Mr. Williams appear to have discovered the way to make it bloom.

ORCHIDS AT MESSRS. VEITCH'S, CHELSEA.—There is now a fine display of flowering Orchids in all the sections in the Royal Exotic Nursery. Amongst the *Vandas* there are fine forms both of *V. tricolor* and *V. suavis*. The *Vandas* are well furnished to the bottom with healthy green leaves, the result of admitting more air and light to them than has been usual previously either here or elsewhere. The spikes are very stout, and average quite a dozen blooms to each. There are some good spikes and good varieties in flower of the handsome long-spiked *Aerides Fieldingii*, one of the best of the species. The *Cattleya*-houses contain some handsome specimens, which are producing a richer profusion of flowers than we have ever previously seen here. The recent importations of *Laelia purpurata* are producing some very fine varieties, and there are few grander Orchids than a large well-flowered specimen of this good old species. Scattered about in the various houses are numerous flowering examples of *Cattleya Mendelii*; this fine species will (if it has not already) become a universal favourite; it is a more choice and beautiful species than *Mossii*, and does not seem to be more difficult to grow. Varieties of *C. Mossii* are very numerous and very good. It is so well known and so easily cultivated, that nothing more need be said about it. Amongst *Cypripediums*, the hybrids raised in this nursery now in flower are very handsome. One of the very best is *C. selligerum* and a major form of it, raised by crossing *C. larbatum* with *C. levigatum*; the flowers are quite distinct and much larger than either parent. *C. superciliosa*, of which there is a handsome specimen with numerous flowers, would make a fine plant for exhibition; it looked at first sight like a fine dark form of *C. Veitchii*, but has been raised by crossing that variety with *C. larbatum*. As seen here in flower it is a first-rate *Ladies'*-slipper. *C. Domini* is also very fine.

MASDEVALLIA.—Mr. Chas. Walker, of Brettenham, Kent, has now in flower the true type of *Masdevallia Harryana* which I named "Bull's-blood." This is a most remarkable variety in point of size, form, colour, and substance. Once seen it and no Orchid grower will ever forget it. Its limbs join each other like a florist flower, its substance looks like leather that we could cut, and its colour is of that deep sanguineous cast that captivates and charms. There are none of its fellows in the numerous lot, well managed here by Mr. A. McGregor, that can at all be compared to it. *James Anderson*.

USEFUL DENDROBIUMS.—This genus of Orchids contains several species that ought to be grown in every garden, because they are amongst the most beautiful flowers in existence, and are so easily grown. I am not sure whether *Dendrobium nobile* ought not to be placed first on the list. The large specimen exhibited by me in London twice this year was placed in my hands seventeen years ago, and was easily potted in a small 48. From that plant we have now about a dozen specimens in various sizes—some in 12 and 13-inch pots. I do not know any other Orchid that could be propagated to that extent and be so easily grown. Then there is no difficulty in having them in flower for six months in the year. The plants are now making their growth, and should be encouraged to do so in a stove temperature of from 65° to 70°. The plants should not want for water at the roots, and may be syringed overhead with tepid water once a day in hot weather. *D. Wardianum*.—Many persons would class this higher than second, but I put it there because it is not so generally useful as *D. nobile*, nor has it proved itself to be so easily increased; but it may also be had in flower during six months in the year, and its flowers are certainly more strikingly beautiful than those of *nobile*. Every grower ought to possess a dozen plants of it, and if he does not yet possess it now is the time to purchase, as there are plenty of plants in the country recently imported, and it never can be cheaper. The plants should be placed in teak baskets or small pans, and be suspended near the glass in a warm house; they will start into growth at once, and as soon as new

roots start from the base of the young growths they require a good supply of water. *D. crassinode* must certainly be placed second to *D. Wardianum*, but it is a very fine species, and differs from the other in having peculiar nodes at each joint in the stem. The flowers rather resemble those of *D. Wardianum*, but they are not quite so large. It requires very similar treatment. The principal point in the culture of the above is to get a good growth during the season, and then give them a good rest, by keeping them dry at the roots and in a cool house. *D. formosum*.—This is a very fine and distinct species, with large pure white flowers with a yellow blotch on the lip. Many good growers have failed to keep this species in health for a long period, but I find it does well suspended from the roof of our plant stove in baskets; the roots are not much disturbed as long as the baskets remain sound. There are a few other varieties and species of Orchids well worthy of culture, but the price is too high at present. *W. Douglas*.

MAKING-UP ORCHIDS.—This question seems to be frequently cropping up, and I was interested in reading Mr. Anderson's remarks at p. 770. I do not think that, if "making-up" was stopped, that Orchid exhibitions would be less interesting. It is true, as Mr. Anderson says, that, owing to the undefined limit in making up, many good and interesting species of Orchids are not now found in competition. I have talked this matter over with exhibitors and judges, but find very few of them take the same view of the matter that I do, and yet it seems a commonsense one. Take, say, a class of Orchids. The schedules say—"Twelve Orchids, distinct." Now I hold if an exhibitor shows more than "twelve Orchids, distinct," he infringes the rule of the schedule, and ought to be disqualified. I find in some collections in the South, when twelve Orchids, distinct, are asked for, that eighteen or twenty varieties are staged. Why is this allowed in Orchids and in no other class of plants? There must be some definition made in the schedules else the number of exhibitors will decrease instead of increase. There are some Orchids that do best in small pots, and cannot be grown into large specimens without parting them asunder, but such are not numerous; perhaps *Cypripediums* and *Masdevallias* would be the only two genera. *Cattleyas*, which are usually made up in the South to the extent of six or more distinct varieties in one pot, ought not to be allowed to be made up. It is injurious to the plants to tear them out of the pots, as the roots of *Cattleyas* cling to the sides as firmly as the limpet clings to the rock. Years ago specimen plants of *Cattleyas* were to be seen at exhibitions, of large size; now all that is needed is a host of young plants, and the man with the big battalions has the best chance. Let a clause be inserted in the schedule to this effect, and I think it would answer every purpose—"All Orchids to be exhibited in the pots or baskets in which they were grown, except *Cypripediums* and *Masdevallias*." *J. Douglas*.

SEEDLING DENDROBIUMS.—In answer to "D. B. C." I may say that it is not an uncommon thing for *Dendrobium* seed to produce plants with two leaves in three months after sowing. I sowed some crossed *Dendrobium* seed on Dec. 29, 1879, and it produced plants with two leaves by March 18 following. The *Laelia* anceps seed-pod, that is changing colour when it opens, will be found to contain mostly chaff—that is my experience of it. The greater portion of Orchid seeds take from ten to sixteen months to ripen, but, of course, there are many exceptions. *Disa grandiflora* ripens its seeds in eight or ten weeks, and produces plants in four weeks; and *Coleogyne cristata* takes two years to ripen, and produces plants in eight weeks. *T. Hyles, Lambert's*.

CATTELEYA SANDESIANA.—We have before us a cut spike of four flowers of this superb *Cattleya*. The flowers measure upwards of 8 inches across; the sepals, rosy-lilac, rather narrow, especially at the base; the two side petals the same colour, broader, oblong, wavy at the edge; the lip folded at the base into a tube; the disc expanding into a nearly semi-circular lobe 3 inches across, deep rosy-lilac, with numerous small pale spots, the edges curled; the throat and interior of the tube golden-yellow, with numerous radiating stripes of an orange brown colour. It comes from the collection of Mr. W. E. Brymer, M.P., and was also exhibited at Stevens' Rooms on Thursday, when many plants of it were sold.

The Flower Garden.

HERBACEOUS PLANTS.—When the bedding-out and the planting of all the auxiliaries of various sorts necessary to the complete furnishing of the beds and borders in the flower-garden is finished, attention must be given to the herbaceous borders, the plants in which have grown very much during the recent rains, and require regulation. Most of the sorts must be timely supported with stout stakes, which if possible should be applied before the plants actually require their help, because then the growth is more natural, and helps to hide the supports, which ought not to be conspicuous at any time. These borders should now afford a considerable display of mixed colour, contriuted by the tall and dwarf Oriental Poppies, the Rose Campion, the double scarlet *Potentilla*, the tall and dwarf *Crocket*, *Fœnias*, and many minor sorts advancing; and more than all, those very useful and showy plants the double and single *Pyrethrum*. These should be extensively planted, and will be found most desirable plants for cut flowers, being very durable. Stakes should also be placed to the strong-growing *Michaelmas Daisies* and *Larkspurs*, strong enough to support them as they advance in growth. The *Funkias Sieboldii* and *purpurea* are very useful, as is also the *Veratrum nigrum*. Whatever vacancies are openend out during these regulating processes may be filled up with any spare plants of annuals or biennials, such as *Antirrhinum*, *Canturley Bells*, *Sweet William*, &c., and as a finish, a narrow hoe should be passed through the whole of the surface to loosen the soil and leave all neat.

BEDDED-OUT PLANTS.—The attention required by bedding plants will not cease with planting out, because as they advance into growth they will soon require a periodical attention to pegging down, and otherwise regulating, so as to keep them all within their proper bounds; particularly where they form part of a geometrical pattern; and another thing, as soon as the hoe has been used, to loosen and level the soil, a mulching of some sort should be laid over the surface to prevent a too rapid evaporation of moisture during the great heat we may expect in the approaching dog-days; and, if the colour is not objected to, the most cleanly, as well as the best material, for keeping down seedling weeds is cocoa-fibre refuse; but where this is objected to I have found a fair substitute in leaf-soil passed through a fine sieve. Coarse dung is not neat, and however much decomposed is objectionable on account of the havoc caused by the birds in their search for grubs.

HARDY FERNERIES.—These are very apt to become over-crowded where they have been established for some time, and will require frequent regulation, so as to keep the sorts tolerably distinct, without which much of the interest is lost. Some sorts increase very much faster than others, witness the *Oncoclea sensibilis*, a very beautiful North American hardy Fern, but it is apt to become a nuisance owing to the tendency to spread itself by the roots in all directions, and choke up everything near it. This can only be remedied by entirely keeping down the creeping-rooted runners from the parent plant, which may with great advantage be transferred to sheltered corners in the woods. In like manner the *Polypodium phegopteris* (the Beech Fern), and *Dryopteris* (the Oak Fern), are apt to spread themselves very rapidly in good soil, and should be kept in proper bounds. This regulation often includes much disturbance of soil, and consequent untidiness, which may with great advantage to the established Ferns be corrected by a good mulching of cocoa-fibre; the Ferns like it, and it is soon hidden; and besides, it keeps down weeds.

RESERVE GARDEN.—This is a very necessary adjunct to the flower-garden in any case, but is quite indispensable where spring gardening is carried out to any extent; and although there is a great pressure of work just now, it must not be neglected on any account, as the spring display depends entirely on the attention now paid to the plants required for it. For example, all the old plants brought from the beds a few weeks ago must have been kept sufficiently

watered, and as soon as leisure will serve the whole stock must be examined and regulated. Cuttings of many sorts will be required, division of roots must also be resorted to, and of scarce sorts seeds may be sown, such as Pansies, &c., so that all may be in readiness for the autumn. An early opportunity must also be taken of dry weather to clean and store away, secure from mice, the bulbs which were laid in sand some time ago. *John Cox, Redleaf.*

Grapes and Vineries.

In the earliest vinery, from which all the Grapes have been cut, it will now be better to let the laterals ramble about within reasonable limits, only taking them out to prevent excessive crowding. If the wood is well ripened dispense with fire-heat, but if not continue to use a little in the daytime only, with abundance of air; give the foliage a good drenching overhead with the garden-engine occasionally in the evening; and water the borders with clear water when dry, which will keep the foliage healthy and clean. If red-spider has been troublesome use the engine every evening until it disappears. The outside border will be better mulched over with short manure about 4 inches thick, which will prevent the drought penetrating into the border; and then, as a rule, outside borders require very little water besides the natural rain; but in dry summers, like last, a good soaking to the outside borders is sometimes required. Succession-houses containing ripe fruit should be kept as advised in my last Calendar. Those that are colouring must now have the evaporating-pans kept dry, and the damping done in the early part of the day. Keep a little air on the back and front ventilators night and day, but do not use much fire-heat in the night, only sufficient to keep the air circulating and dry. Turn on extra heat in the early part of the day, giving more air as the temperature rises. Water the borders when dry with clear tepid water; but if the border was thoroughly done when they commenced colouring it is generally sufficient. Such kinds as Foster's Seedling and Madresfield Court, if thoroughly watered when they are about half-coloured, have a greater tendency to crack, and the watering must be done at that time with great care, and if the soil is fairly moist defer watering for a short time. Those that are swelling their fruit keep in a moist growing atmosphere, giving good supplies of tepid manure-water at the roots when required; close the house early in the afternoon, allowing the temperature to be 90°, after closing with bright sunshine and plenty of atmospheric moisture. Admit air early in the morning on the back ventilators, and increase it as the temperature rises. The latest house will now be partly thinned, and when this is completed give the inside border a good soaking of tepid manure-water; but if the roots are all outside they will be wet enough for the present. On bright days no fire-heat will be required, but on dull days it is better to turn a little on in the early part of the day. Muscats that are nearly ripe can be kept in a drier atmosphere, but must not be allowed to get at all dry at the roots. Clear tepid water will now be best. Leave a little air on the back ventilators night and day; those in succession-houses can be kept at a night temperature of 70°, with a rise of 10° by day. Give air early in the day, and close the house early in the afternoon, damping the paths and borders with tepid water at closing-time, and on bright days the thermometer may rise up to 90° to 95°, and then they do not require much fire-heat through the night. Give abundance of tepid manure-water at the roots. Late varieties of Grapes for keeping through the winter will be better kept at a night temperature of 65° to 70°, with a rise of 10° by day. On cold dull days they will be better with a little fire-heat on all day. Houses in which Lady Downe's or Golden Queen are growing will do better with a little air left on all night, and a drier atmosphere than for other Grapes, or else they are liable to scald as they finish stoning; afterwards treat them like other Grapes. Newly planted vineries must have plenty of heat and air, to make the growth early and short-jointed, giving them abundance of water at the roots. The earliest pot-Vines that are the required length, and stopped, will now take liberal supplies of tepid manure-water at the roots, and stop the laterals as they require it. On bright days give them a good syringing overhead at closing time in the afternoon, and admit air early in the morning. *Joshua Atkins, Lockings Gardens, Wantage.*

The Hardy Fruit Garden.

EXTENSION shoots of Peaches and Nectarines will now require to be nailed in; also commence laying in the more forward of the shoots in the interior of the trees, and at the same time see that no more growths are being retained than are really necessary. Much crowding and confusion frequently result from timorous treatment in disbudding, and it cannot well be too often repeated that, only by allowing every leaf room for free development, can we hope for perfectly ripened wood on the open wall even in the best of seasons. The breastwood of Pear trees on walls and espaliers will now require attention. Let the shoots be pinched in to three or four leaves on varieties of medium growth; but others may require to be cut back more or less closely, according to the vigour of the sort. Trees that are already well furnished with spurs may require the principal part of the growths broken out, rather than pinched back to form spurs that will be too much crowded, retaining only those that are requisite for forming fresh spurs, either for filling up weak places, or for taking the place of older spurs which it is considered desirable to remove at the next pruning. Preserve the balance of the trees by proceeding with the removal of growth from the higher portions, in advance of the same operation on the lower branches in cases where the growth is seen to be disproportionate. In some instances it may be found of advantage to allow a little more extension on weak branches, and on the e disadvantageously placed as regards position for commanding the flow of sap; and to adopt proportionately close pinching for the shoots of the upper and more vigorous branches. Keep a sharp look-out for the first evidence of the Pear leech, and destroy by dusting with hot lime before it succeeds in destroying the appearance and usefulness of the foliage by its rapid operations; repeat the application of quicklime if the first prove insufficient, or in the event of successive broods appearing. The crop of Pears are so generally a failure this year that those who have much thinning of fruits to do may consider themselves particularly fortunate, and any set about the work will the greater care and attention on such trees as require this operation; for a plentiful supply of good Pears does not seem to be a likely thing in most gardens this season. It will be desirable to take as full a crop as is likely to be brought to perfection by any trees that are fortunately fruitful, even should the bearing power of the tree be too severely taxed to respond to a call for fruitfulness on a following year when other trees may possibly well supply individual deficiency. Cherry walls will require frequent attention in keeping down the black aphid. Apply water often with such force as to allow no chance of the fly establishing itself; but when once it secures a footing it may be necessary to remove the points of all affected shoots, also any curled leaves that afford a secure lodgment where the force of the water can scarcely reach the insects. Finish the removal of any breast-wood that may have been neglected up to this time, and see to the preservation from birds of May Ducks and other early Cherries that are commencing to show colour, securing the nets tightly at the top and bottom of the wall, and supporting them away from the fruit, to prevent the birds from reaching it, by stocks of suitable length thrust against the wall, and holding the netting in position by being cleft at the top. Where small birds are found to be troublesome, it may be necessary to protect the fruit by using a double net, which will generally be found to effectually baffle even the smallest of the daring little depredators. Nets will now be required to preserve the Strawberry crops, which promise to be heavy, and it will be well to see in time that a sufficiency is in stock for the various crops for which they will shortly be needed. Grafts will require to be attended to in securing the advancing growths firmly to some sufficiently stable supports, to prevent danger of being broken out by winds; all tight ties that have not yet been unloosed ought to be seen to at once, and it will be advisable to again re-tie for a season, to prevent any chance of the opening of the newly-formed tissue. Continue to keep Raspberries within bounds by frequent use of the hoe, to remove unnecessary and widely rambling suckers, and see to the removal of suckers generally from wall and other trees, as frequently as they make their appearance. *Ralph Crossling, St. Fagan's.*

The Pine Stove.

WE prefer the system of cultivation in pots to that of planting out, as when plants are in pots they are better under control. It is true that plants growing in beds do not require the same care and attention that plants in pots do, the roots not being so liable to suffer from drought or neglect of watering; but against this advantage may be set the economy of space that results from the former system. Where the planting out system is adopted, the bottom-heat must be supplied by hot-water pipes, this being the only medium that can be depended upon. With plants in pots the task is different, as they can be worked or placed according to altered conditions. To prepare beds for planting out, the bottom-heat pipes should be covered over with thin slate about 1/4 to 1/2 inch thick, and the brickwork should be pigeon-holed, to allow the bottom-heat to circulate freely under the slates. Over the slates only about 1 inch of drainage is required, then the turf or loam put downwards, and over this about 15 inches of good turfy loam, with about one 18-inch potful of ground bones and bone-dust in equal parts, with a little charcoal. Although the planting-out system is not so general as in pots, yet there are many places where this is carried out. The advantage of the pot system is that so much soil is not required as when planted out in beds. It is thought that Pines planted out in beds having a larger body of soil to grow in bloom more vigorously and produce larger fruit, but this is not the case. Another point of considerable importance is, that plants in successive stages will fruit prematurely when planted out even under the best management. When this happens it is difficult to replace them, as it is not an easy matter to keep duplicate plants exactly the same size to fill up the gaps thus made. Even when the places are filled up of plants that bolt, those established plants that grow on in a proper and satisfactory way take the lead, which gives the houses or pits an irregular appearance. It is seldom also that plants when planted out start and ripen at the same time, and this is a disadvantage. When plants are grown in pots these defects can be remedied, as the empty spaces can be filled up at any time to suit circumstances, or the whole may be mowed if they are required. Directions given still hold good for temperatures, watering, and ventilation for the present. All young stuff should be well taken care of, so that the plants do not become drawn in early stages. Saturate the atmosphere with moisture in all the pits or houses, to promote and assist rapid growth. *D. Wilson, Castle Hill, Devon.*

The Orangery.

IT may not be amiss to repeat what I must have said before—that to grow Orange trees well enough to produce fruit of superior quality to place upon the dessert-table there are a few essentials that cannot be dispensed with. It seems necessary to urge the following points, because one seldom sees the trees doing so well as they ought to do. In the first place peaty soil, such as imported trees are potted in, will not do. Good turfy loam, enriched with some stable-manure and bone-dust, is the best material to support the roots. In putting the compost should be pounded in rather firmly; the pots to be well drained; and as the trees may be two or three years—or, in the case of large specimens, even longer—in the same pots, some fibrous loam, free from dust, should be laid over the drainage. Cleanliness is next in importance. The Orangery is often infested with scale, and mealy-bug will also get on to them. There is no better plan than to wash the trees with strong soft-soapy water, washing leaves and stems thoroughly. They may then be kept clean by thoroughly washing them with the syringe every day. Temperature is also of vital importance. Oranges will become yellow, the hue of ripeness, and they will grow to a large size in an ordinary greenhouse, but they will not be eatable. To have them of good flavour they must be grown in a stove temperature. Then the varieties must be selected; varieties usually imported from France will not answer. Tangierine, Maltese Blood, St. Michael's, and Plata, or Silver Orange, are the best. They should now be grown on in a high temperature, with a moist atmosphere; but if the fruit shows any sign of cracking, keep the trees rather dry at the roots. *J. Douglas.*

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, June 21.—Flower Show at Burton upon Trent
 THURSDAY, June 22.—Royal Botanic Society's Evening Fete
 Flower Show at Chiswick.

WELLWISHERS OF THE ROYAL HORTICULTURAL SOCIETY are looking with some anxiety as to its condition and prospects. The state of affairs is not so bad but that it might be worse, the prospects at present are, however, it must be admitted, far from bright. Nevertheless there is so much vitality in the Society, as evinced among other things by the large numbers of new Fellows, that we are far from taking a pessimist view of the situation. One of the most serious causes of apprehension is the falling off on the part of those exhibitors who have hitherto so staunchly supported the Society. If this decadence were confined to the larger shows we should not think so seriously of it, but when it begins to affect the smaller committee-meetings it is clear that one of the most useful features of the Society is imperilled. There is a marked tendency of late on the part of the great trade exhibitors to establish private exhibitions of their own, and it is obvious that from many points of view this may be more convenient to them than to send away van-loads of delicate plants from their houses at the very time when visitors may be expected to be most numerous at the nurseries. But as one main object of the trade exhibitor is to secure publicity, it is at least doubtful whether that is so well secured as at an exhibition to which the public come in numbers, and which is more or less fully reported in all the gardening journals, and more summarily even in the ordinary newspapers. At the same time the abstention of the larger London exhibitors should prove the opportunity of the smaller provincial ones, who hitherto have had a poor chance.

Be this as it may it is clear that a great change is in progress as regards exhibiting, and it behoves the Society's officers to watch the turn of events and shape their course accordingly. For our own parts we think the multiplication of large shows—one the mere replica of the other—a mistake in many ways. It is a mistake, inasmuch as horticulture is not particularly advanced by premiating the same plant of *Cycas revoluta* or *Erica Cavendishiana* every year. This is not only costly, but futile, so far as the advancement of horticulture is concerned. What is learnt, what advance is made by these perpetual displays all over the country of the self-same stove and greenhouse plants, or, if not the same, their brothers? It may be argued that these are requisite to make an effect at a large show, and that is true. But the question we would like considered in the present pecuniary state of the Horticultural Society is—Are large shows desirable? They are very costly—they fail in attracting the London public, and they do not promote the object of advancing horticulture in any degree proportionate to their great cost. We believe it is a fact, that the Whit-Monday visitors who paid 2s. a head simply for the privilege of visiting the garden, and for whose entertainment little or no extra expense was incurred, were by far more profitable visitors than those who come to the big shows. In considering, therefore, what must, what can be done to place the Society on a satisfactory basis, the question of the large shows and the large sums paid to trade and professional exhibitors must, we think, have a foremost place. We do not advocate the entire abolition of these great displays—far from it; we would only restrict their number and reduce the sums paid to what we may term professional exhibitors—that is, to those who quite legitimately make a business of exhibiting apart from any desire of advancing horticultural progress.

Then there is the question of the South Kensington Gardens and their maintenance.

It is certain that some portion will shortly be required by the Commissioners, and we cannot but hope that they will require and will take off the Society's hands the greater portion, leaving only such portion as may be necessary for the Society's meetings, offices, library, and for occasional large exhibitions. We do not know what proportion of revenue is derived from lawn tennis and other objects of a non-horticultural character, but we are prepared to believe that a considerable reduction of income might at first be expected if these were abandoned. On the other hand, the expenses of management would be lessened, and a further saving would be effected by curtailing the large shows, as we have suggested.

We would develop the strictly horticultural element as far as possible. We would continue and improve the fortnightly meetings, introduce some much needed reforms to prevent the multiplication of certificates to plants of no special interest except commercially, and to secure that plants of real interest (apart from mere trade considerations and fashionable caprice) shall receive recognition proportionate to their merit. We would encourage the exhibition on the part of amateurs and others of instructive series of specimens, representing certain groups—such, for instance, as those of the Rhododendrons exhibited by Mr. MANGLES this spring.

The publications of the Society, which have of late years conferred little lustre upon it, chiefly on account of the long intervals that have elapsed between successive issues, should be reorganised and issued promptly. It is true that the gardening Press must always have the advantage in the matter of early publication, but there are many valuable reports and comparative statements which would be strictly within the province of the *Journal* of the Society, and for which room could not be found in the gardening newspapers. Who that reads the elaborate reports of the American Pomological Society, for instance, but must blush for the reports issued by our own Society! While writing of this matter, the report on the influence of the recent winters on vegetation comes to mind, and we can but regret that the finances of the Society are such that what we believe, when properly edited, would be a most comprehensive and valuable document, is still unpublished, and, for aught we see, is likely to be so; and all the time money is being spent for the benefit of lawn-tennis players, and the funds and resources of Chiswick most unworthily taxed for the decoration of a conservatory of no use whatever to horticulture proper.

The object of the Society is to advance horticultural progress—the promotion of what we may term recreative or decorative horticulture, as well as of commercial horticulture, should be merely secondary or incidental: neither require the assistance except occasionally, and on a limited scale, of a great society. Each is perfectly well able to take care of itself, independently of any aid the Society can give; and the funds now expended on those departments might more wisely be spent on the advance of horticulture proper. We know the argument held is, that if the subsidiary adjuncts are discarded the Fellows would fall off, the funds would decline, and the Society would be worse off than ever. We admit that a large proportion of Fellows might fall away: well, they would not be the element we most wish to retain. We admit that the finances would fall correspondingly, but on the other hand the expense—much of which at present is quite uselessly incurred as far as horticulture is concerned—would be much lessened also. Again, when the Society wakes up to its duties, and makes its influence felt for good in every village and every allotment

garden in the country, its finances would improve as its influence extended; and we might look forward to a real national horticultural society looking to horticulture proper, and to the country at large, and not to mere fashion and tennis-playing at Kensington, for its support.

— FRUIT PROSPECTS.—At a sale of the fruit produce of numerous orchards which took place in West Middlesex recently, a fair indication was given of the comparative condition of the orchard fruits in that district. In some instances the bids made by experienced buyers did not reach by one-half the reserve price, in others not more than one-half was given for orchards than has been given in some previous years, and in the majority of cases the lower or bush fruits were the chief stays of the crop, that above being lamentably thin. Here and there were some fairly good Cherry orchards, which sold very well, the prospect of comparative scarcity in many kinds naturally enhancing prospectively the price of the fruit. Cherries, however, are uncertain fruits, the birds manifest for them special longings, and will, ere the unwary proprietor is awake, often play havoc with his crops. The Bigarreaux, too, even if they escape the feathered thieves, are specially liable to crack and bruise should rain and wind come at a critical moment; and then, not least, Cherries are such easily transported fruit that with none other perhaps is their storage competition in the market. One man who purchases a large orchard of these delicious yet uncertain fruits needs considerable courage. The grand bloom seen on the Pears last April has proved peculiarly deceptive. It has nearly all dissolved and left hardly a trace behind. Here and there upon Hessele and other fairly hardy Pears there is a mere sprinkling of fruit, and that is all. With Apples it is even worse, for these present but a miserable promise, and indeed we may prognosticate one of the poorest Apple seasons known for years. Of Plums there is a sprinkling here and there in well sheltered orchards, but even of these many fruits have failed to cross the stoning rubicon. The mainstay of the market fruit growers this year will have to be found chiefly amongst bush fruits and Strawberries. Gooseberries generally are plentiful, and Currants are fairly good. Raspberries promise a fine crop, as also do Strawberries, but both are contingent upon warmth and sunshine. If these fall just now fruit growers will have little cause to rejoice over the season of 1882.

— PEOPLE'S PARK, GREAT GRIMSBY.—At a recent meeting of the Grimsby Town Council, the prize of £50 offered by the Corporation for the best design for laying out the new park was awarded to MESSRS. WILLIAM BARRON & SON, Elvaston Nurseries, Borrowwash, near Derby. There were twenty-four competitors. The site of the park was presented to the town by E. HEANEAGE, Esq., M.P., and comprises 27 acres. The accepted plans provide for an ornamental lodge at the entrance, cricket ground, bowling green, archery ground, lawn tennis ground, a piece of ornamental water about two acres in extent, refreshment pavilion, band stands, shelters, &c.

— PELARGONIUM BELLE DE JOUR is one of a batch of M. LEMOINE's interesting seedlings now in flower at Chiswick that well deserves the attention of those who have to meet a demand for cut flowers. It belongs to what is now generally recognised as the "decorative" type, and has pure white semi-double flowers, borne on stiff erect stems. The plants give a great crop of flowers, but only one or two trusses seem to open together, and it is this continuous as distinguished from the simultaneous habit of blooming that renders Belle de Jour so desirable a novelty.

— WEATHER ASPECTS.—If June be the first month of summer then the present opening of that acceptable season is not a propitious one, neither does it indicate that warmth and brightness so essential to the welfare of crops of every kind. It is not at all a pleasant sensation to find the body shivering with cold in the middle of June, when we should rather be like the traveller in the fable, casting off our winter garments under the powerful influence of the sun's heat. We rather have to gather the folds of the winter's cloak once more closely round us, to shelter the body from the pitiless rain and the cold north-westerly blast. If humanity—stealed against unseasonable cold by years' experience to wintry winds and frost—finds it thus so hard to endure the now unusual low temperature,

how much more badly must tender vegetation fare?—for that the larger portion is like the exotic bird of passage. It opens out its luxuriant foliage and lovely flowers with the advance of spring, and retires again into its natural shelter and repose at the approach of winter. If, because of cold winds and cloudy skies now, the tender leafage should become blighted, cankered, and withered, how can we feel surprise? The weather as we write is rather that of advancing winter than of the coy smiles of summer. The haymaker is in tribulation, for with one of the best crops of grass seen for several years, the unpropitious weather seems about to snatch the hopeful draught of prosperity from his lips. A week's sunshine and warmth means wealth and happiness to him, whilst a week of storm and clouds only brings failure and disaster. The market grower and the seed grower sees his large breadths of Peas making abnormal growth, a development of haulm and leafage that is far too robust to promote a profitable crop. They, too, sadly need warmth and sunshine. Potato growers—and they are legion—are in grave trepidation

in question differs from those called knaurs in the absence of adventitious or latent buds. We have frequently met with similar malformations, as in the Cedar of Lebanon, the *Taxodium distichum*, &c., but we are by means clear what are the circumstances which favour their production.

—THE UTILISATION OF ANTS IN HORTICULTURE.—Professor RILEY contributes the following note to a recent number of *Nature*.—"Dr. C. J. MACGOWAN has sent me, from Hanchow, Province of Hainan, China, a little paper on the 'Utilisation of Ants as Insect Destroyers in China.' It seems that in many parts of the Province of Canton the Orange trees are injured by certain worms, and to rid themselves of these pests the inhabitants import ants from the neighbouring hills. The hill-people throughout the summer and winter find the nests of two species of ants, red and yellow, suspended from the branches of various trees. The 'Orange ant breeders' are provided with pig or goat bladders baited inside with lead. The orifices of these they apply to the entrance

now, measures at 5 feet from the ground only 2 feet 8½ inches, though it is about 82 feet high.

—A PEACH TREE AT BEARWOOD.—A truly remarkable example of a Royal George Peach may be seen in one of the Peach-houses at Bearwood. It completely fills the interior of the roof of a lean-to house 20 x 14½ feet. The tree is in the best possible condition; it could not well be more vigorous in growth and healthy in appearance, and the stem is in proportion to the tree, and of the same thickness throughout. The crop of fruit, now rapidly reaching on to ripeness, is very large, and individually the Peaches are of splendid development. It is a crop much above the average, but the tree is in such perfect health, and so robust in all its parts as to be able to carry it to a most successful issue. Mr. TEGG wins high honour over the management of this splendid tree, and the achievement well deserves a record. It is when one looks on to the tree through the glass from the outside that the amount of the crop is realised. It may be added that the

FIG. 123.—MAMHEAD HOUSE, DEVONSHIRE. (SEE P. 796.)

as to the effects of the cold rains and cloudy skies upon the tender foliage and stems of their too sensitive crops, and already dread, if they do not actually see, the approach of the terrible fungus. Even the farmer whose corn breadths now look so full of promise, scans the sky anxiously, and pronounces for sunshine and fine weather, is apprehensive. It would indeed, when so much looked so bright and promising, be a bad misfortune were our recent mild winter to be compounded for by a succeeding cold summer.

—ROOT TUMOUR ON SPANISH CHESTNUT.—The Rev. L. BLOMEFIELD kindly sends us a memoir of his, illustrated by photographs, representing a smooth globular tumour on the root of a Spanish Chestnut. The tree had been planted about fifty years, and in the autumn of 1881 one half of it appeared to be dying, the other half being still vigorous. On examining the roots, on one of them, on the same side as that half of the tree that was dying, was found this callosity at a distance of about 8 feet from the stem of the tree. The growth measured 2 feet 6½ inches in circumference, 10 inches in length, and 9½ inches in diameter. The growth

of the bag-like nests, when the ants enter the bladders, and, as Dr. MACGOWAN expresses it, 'become a marketable commodity at the orangeries.' The trees are colonised by placing the ants on their upper branches, and Bamboo rods are stretched between the different trees, so as to give the ants easy access to the whole orchard. This remedy has been in constant use at least since 1640, and probably dates from a much earlier period. This is certainly a new way of utilising ants, which, as a rule, are deservedly considered a nuisance by the horticulturist. Professor RILEY would like to learn from any reader whether the facts communicated have before been known in Europe, and, if so, whether the species of ant has been determined."

—*PIETHECOLOBIUM SAMAN* (THE RAIN TREE).—A specimen of this in the garden of the Agri-Horticultural Society of Madras, supposed to have been planted in 1873, measured in October last 10 feet in girth at the ground level, 6 feet 6 inches at 3 feet, and 6 feet at 5 feet. It is said to be a "perfect tree for sandy and alluvial soils in tropical countries." A *Casuarina* tree standing alongside, about ten years old

Early Grosse Mignonne is regarded by Mr. TEGG as the best early Peach in cultivation.

—THE DISPOSITION OF FLOWERING SHRUBS.—Those who excel in the art of flower gardening are, generally speaking, men who are methodical in their ways, and who are gifted with the power of observation to notice the right and wrong of things in proper season. The flower gardener knows to a nicety months beforehand what kind of display he may expect from a given quantity and variety of plants. When the flower garden is at its best he notes defects and takes means to remedy these defects another season. Can as much be said in the case of flowering shrubs? Unfortunately any judgment formed upon actual observation proves the reverse. There are many beautiful shrubs now in flower which will enable any one who is disposed to improve matters in this respect to take note of such changes as are likely to lead to improvement another season. What is wanted is a succession of bloom and something like an artistic blending of colours, which is as necessary in the case of flowering shrubs as in the arrangement of the

choicest plants in the flower garden or parterre. Take for example a dense background of green and introduce at certain points a tall plant of *Halesia tetraptera* (the Snowdrop tree), or a plant of *Pyrus malus floribunda* or *Weigela rosea*, or a good specimen of *Deutzia crenata fl.-pl.*, and a transformation is effected which will charm the eye of any one who is not totally oblivious to the beauty of well disposed trees and shrubs. Many changes for the better have taken place in our ornamental gardens of late years, but there is something still left to be accomplished in our manner of disposing ornamental and flowering trees and shrubs.

— AMERICAN GARDENS.—It is by no means certain whether, with all the zeal that is professed by a certain section of the community for hardy plants, that full justice is done to the American garden, or rather to the plants of which such gardens are composed. A good collection of so-called American plants, tastefully arranged, would bridge over the gap that undoubtedly exists between the show of spring flowers and what is commonly accepted as the bedding season. Choice groups of *Rhododendrons* intermixed, *Ghent Azaleas*, of which there is no end of variety, and *Kalmias*, are sufficient in themselves to make a display, extending over several weeks. Of *Ghent Azaleas* alone a fascinating display may be made by grouping the different shades of yellow, buff, scarlet, crimson, and orange together. Enclose, or partially enclose, a *Copper Beech* with a deep band of these plants, and you have an effect during the month of May which is not exceeded at any other period of the year. Have a group of white and purple *Rhododendrons* a little way off by way of variety, or have a deep strain of yellow *Azalea* next to the purple *Rhododendron*, or a bush of *Deutzia crenata fl.-pl.* next to the purple, and a rich effect is also produced. Many gardens are spoilt by planting things higgledy-piggledy together, instead of having substantial groups of the same species of plants planted *en masse*. There is still plenty of room left for medley beds and borders of single specimens, which are also necessary, but the massing system must predominate if there is to be an imposing effect.

— FRUIT PACKING PRIZES.—The useful and instructive competition promoted by Messrs. WEBBER & Co., fruit salesman, Covent Garden, with a view to bringing about a wider knowledge of the best methods of packing fruit for market, again takes place in the Royal Horticultural Society's Garden, at South Kensington, on the occasion of the Pelargonium Society's Show, June 27. The details of the competition will be found in another column.

— FUCHSIA FRENCHENSIS.—Since hardy *Fuchsias* have come into vogue again every one seems to want big bushes, as if—hardly though they be—they can be grown by magic. Even the fastest growing *Fuchsia* wants time to grow into a giant. But why not have *Fuchsias* in masses where the climate is favourable? A whole bed of *Fuchsias*, 12 to 18 inches high, is surely as pretty and as graceful as a bed of *Verbenas* or *Pelargoniums*. The variety under notice will make a permanent bed: you have only to cut down the shoots close to the ground in the autumn, and they grow away the following spring without further trouble. The cost of a dozen plants is less than the price of a dozen of the commonest bedding plants, and once planted you have something to look at nine months out of the twelve. The colour of the leaves and shoots is dark, which adds to its utility for bedding purposes.

— PALMS AT THE SHEEN NURSERY.—Within the memory of many who are not yet overburdened with years *Palms* were scarcely to be met with in this country beyond those that were to be found at Kew and the isolated examples in a few public gardens. Plants that did not produce flowers of a showy description were not thought worthy of room; form without bright colour was little appreciated. Now all this is changed, and *Palms* are required by the million of all such kinds as will thrive without a constantly high temperature, and that can be kept in a healthy condition without occupying too much room. To meet the demand nurserymen are not slow in providing an adequate supply. Mr. KINGHORN has several long houses principally filled with *Palms*, and recently an additional span-roofed structure, 50 feet by 18 feet, has been built. It is a very substantial

good-looking house, constructed as the trade now almost invariably build, to admit the greatest amount of light, with nothing near to obstruct or diminish this essential element. It is filled with all the best kinds, including a large proportion that will thrive without much heat. It would be difficult to imagine anything in the shape of an assemblage of these plants in more beautiful condition than the stock in this and the other houses devoted to them, showing at once the advantages of good light quarters and clearly attentive cultivation. The way *Palms* are often treated by many, who grow them in dark houses, huddled together, and in anything but a cleanly state, tends to the supposition that they will do with any sort of treatment, but a glance at a well-grown collection like the Sheen plants quickly dispels this. Where the growth is made under favourable conditions the leaves, independent of their better appearance, will last fresh twice as long as where grown in semi-darkness.

— A CURIOSITY IN SALE CATALOGUES.—All the world knows that Dundee is famous for its "interest" in the vegetable kingdom, *i.e.*, big flower shows, Horticultural Associations, jute and marmalade, and the Dundee School Board has the pleasure and profit of being presided over by a most estimable gentleman, who is also an "eminent horticulturist," but if we may judge from a catalogue before us, of a collection of plants sold by auction last week, the great "interest" of the town has but a very slight bearing upon the education of its auctioneers' clerks. We cannot pretend to notice all the eccentricities of this curiosity, but add a few, to show auctioneers and their clerks the desirability of calling in professional aid when dealing with things that they know nothing about. *Cycas Revoluta* is described as "a gorgeous showy plant," other departures from the usual are found in such things as *Adiantum Trapeziforme*, *Asplenium Dalbifolium*, *Pendulis Vechi*, *Physacanthis Rutilanda*, *Coleus*, *Francia Lakifolia*, *Sellegonella*, *Nephrrolepis*, *Hibiscus-Pakern*, *Pentradina-Rosea*, *Acrochordus Immersa*, *Croton Cuddiatum*, "a lovely plant," and *Pendulis*, "a very valuable showy *Palmy*."

— THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 21st inst., at 7 P.M., the following papers will be read:—"A New Metal Screen for Thermometers." By the Rev. FENWICK W. STOW, M.A., F.M.S. "On the Effect of different kinds of Thermometer Cribbs and of different Exposures in estimating the diurnal range of Temperature at the Royal Observatory, Cape of Good Hope." By DAVID GILL, LL.D., F.R.A.S. "Account of a Cyclone in the Mozambique Channel, January 14—19, 1880." By CHARLES S. HUDSON. "Rainfall of Freetown, Monrovia, East Coast of Africa, 1875—81." By R. H. TWIGG, M.Inst.C.E., F.M.S.

— RHODODENDRONS AT COOMBE WOOD.—The complete collection of *Rhododendrons* in Messrs. VEITCH'S nursery have flowered splendidly this year, and the amphitheatre-like form of the grounds surrounding the extensive dell where they are grown gives an opportunity for the wide expanse of varied colours being wholly seen at once, presenting a sight such as few positions similarly planted afford. Soil and situation alike favour luxuriant growth; the stock collectively is in the finest possible condition, and contains all the best varieties, old and new, that are in commerce. Standard and bush-shaped plants alike presented an even sheet of bloom that almost entirely hid the leaves. Where every variety grown may be set down as possessing merit such as to make them deserving of a place, it is somewhat difficult to particularise; yet, apart from any consideration of the variety being old or new, or taking into account excellence in form or marking in the flowers, there are a few that stand out so markedly for distinction in shade, combined with profuse habit of blooming, as to make them conspicuously effective. Of such are *Lord John Russell*, pale rose, finely spotted; *Fommosum elegans*, glowing pink, the flowers having a peculiar pretty shade; *Old Port*, deep plum colour, one of the most distinct; *Everestianum*, lilac, amongst the freest of the tree; *Michael Waterer*, rose-scarlet; *John Waterer*, vivid crimson; *Madame Mielan Carvalho*, pure white; *Mrs. John Clutton*, white: this and the last named are most telling

kinds; *Purpureum grandiflorum*, bright purple; *Crown Prince*, bright rose; *Joseph Whitworth*, lake; *Pastuosum flore-pleno*, mauve, large truss; *Caractacus*, crimson, shaded purple. The profuse disposition to flower, and distinct telling colours possessed by the above, make them distinguishable even at a long distance—amongst a host of others, comprising every shade through the wide range of colours that these unequalled hardy evergreen shrubs afford. In new sorts are two, raised by Messrs. VEITCH, that from their distinct character and general excellence will doubtless become favourites—*Duke of Teck*, bright magenta, shaded with rose; on the upper petal is a well-defined white blotch with orange-brown spots, the edges of the petals prettily fringed; *Mrs. Cameron*, extremities of petals deep bright pink, paler towards the base, well-defined orange spots.

— Messrs. JAMES CARTER & Co. ask us to call the attention of our readers to the fact that they are this season offering prizes of various amounts for varieties of Peas sent up by them at the exhibitions to be held at Chiswick, South Kensington, Richmond, Bagshot, Twickenham, and Oxford. For further particulars see our advertising columns.

— KALMIA LATIFOLIA AT BEARWOOD.—This has been well denominated the "king of the species" comprehended in this genus, and a visit paid to Bearwood, Wokingham, just now would enable one to realise this fact. There can be seen in plenty enormous bushes of *K. latifolia*, planted years ago, and which, in common with the *Rhododendron*, have in course of time, and being in suitable soil and a congenial situation, grown into enormous size, and are this season blooming in wonderful profusion, throwing up thousands of trusses of flower in happy plenteousness. Year after year these giant plants bloom freely, and to keep themselves within reasonable bounds a little pruning is necessary, but it is sparsely done. It is to be noticed that the flowers of some of the plants are a little darker than others, and perhaps situation may have something to do with this, or it may be the plants were seedlings, and some variation would naturally present itself. At Bearwood there are huge clumps of *Rhododendrons*, with which are mingled *Kalmia latifolia*, and the margins are lit up with fine plants of the richly hued American *Azaleas*. This is a combination of surpassing beauty, and quite in harmony with the extent and general character of the pleasure grounds at Bearwood, and the admirable manner in which they are kept does the greatest credit to the gardener. Probably owing to the high and dry character of the situation and soil but little harm was done during the severe winter of 1880-81 to the fine collection of coniferous plants growing at Bearwood. They are this season, in common with most trees and shrubs, making a very free and generous growth; and some of the specimen *Coniferae* are almost unrivalled for symmetry and handsome proportions.

— THE COOMBE WOOD NURSERY.—Among flowering plants in the Coombe Wood Nursery is *Frenontia californica*, growing on a low wall in one of the plant-houses, where it is quite at home, and producing freely its singular flowers, which in form are not unlike those of *Anemone japonica*, but shorter and more pointed in the segments, golden-yellow inside, deeply tinged with red on the outside. *Magnolia Soulangiana nigra*: This is one of the most distinct of all *Magnolias*, and has the valuable property of beginning to flower early in spring and keeping on for a length of time. It is perfectly hardy, having here withstood the recent winters quite uninjured without any protection. The flowers are large, the outside of the petals deep claret, inside much paler; they keep appearing in succession. It is one of the finest of the family. Fine as the old *Guelder Rose* (*Viburnum Opulus*) has been this year, it does not come up to *Viburnum plicatum*. In the borders here the lower branches have been literally weighed to the ground with their long wreaths of flower; as many as fifteen of its big snowy bunches have been counted on eighteen inches of shoot. It possesses a purity of colour such as few white flowers can boast of, and it makes one of the best wall plants, keeping on flowering down to the bottom after its branches have reached far away. *Cistus purpureus*, one of the densest flowering of the genus, forms a low spreading bush, 4 feet across, by 2 feet high,

clothed so thickly with its white petalled golden anthered flowers that there is scarcely room for them to open. *Ulex nana expansa*, is a pretty Furze that deserves a place everywhere, especially where a profuse blooming plant is wanted that takes up little room, for it is so close in habit as to look as if clipped over with a pair of shears, and its yellow flowers are so profuse as to hide the wood. *Cydonia Maulei* is a fine kind, not nearly so often seen as desirable; its bright red flowers are produced freely, and it keeps on blooming for a long time: it was in flower here up to June. Those who are only acquainted with the old Weigela rosea, and one or two others of the better known sorts, have little conception of the beautiful colours which some that have more recently made their appearance possess; they now range from quite white to the deepest crimson-red, presenting in themselves enough variety to lighten up a shrubbery during the time they are in flower. Beyond the quantities of shrubs in bloom, the numbers of shrubs and trees that have just donned their new garb present an endless variety of colour and shades, which are more than usually brought out this year, such as assume a yellow hue being extremely bright; the golden varieties of the Lawson Cypress, *Retinosporas*, *Ivies*, *Eucynmus*, *Dox*, *Privet*, of which the golden oval-leaved variety is one of the most telling of all yellow-leaved plants, combined with quantities of other things with bright young foliage. The Japanese Maples alone are a study in their shades of colour, from the softest Tea-green to the deepest ruby-purple. Somehow or there appears to be an erroneous impression abroad amongst those who are not fully acquainted with trees and shrubs of recent introduction, that most of these Acers are not hardy. Big vigorous growers that reach the dimensions of timber trees they are not, neither is it by any means desirable that every species of plant cultivated in a garden should attain such dimensions; and if these elegant miniature trees were large growers they would lose half their charm. The majority of them are as hardy as anything need be—so far, at least, as the southern portion of the kingdom goes, and they may be equally so in the north, at least we know they are so at Borrowash. The numerous kinds planted out at Coombe Wood were no more affected by the cold of the recent really severe winters than the Oaks in the neighbouring woods.

ECONOMIC PRODUCTS OF PEKNAMEBU.—Writing on the trade of Pernambuco Mr. Consul BONHAM says the chief products are sugar and cotton—the former being grown on all the lower lying ground and in the valleys, while the latter is chiefly grown in the distant interior. Coffee is grown in small quantities, and in former years a little was exported, but it has not been found to answer since owing to the climate. It does not produce fruit at any regular season, but does so more or less all the year. This is found to be a great hindrance to growing it in large quantities, though for private consumption a fair amount is produced. It is stated that there is land in the interior, where the climate is somewhat cooler, which is well adapted for the cultivation of Coffee. Eventually, when the interior is opened up, it may be found to succeed and become an important product. On the subject of Cocoa it is stated that attempts are being made to introduce its cultivation, and large plantations are in course of formation. It is probable that it could be cultivated successfully, and in future years it will most likely rank amongst the staple products of the country. Large plantations of the Coccolut Palm exist near the sea, but the nuts are not exported in any quantity; some, however, are sent to the south of the empire. A large trade might be done in this article. Tobacco is grown in the province, but not in a sufficient quantity to meet home requirements, since much is imported from Bahia. There is no reason why the cultivation of this article should not be immensely increased, as the country is well suited for its growth, and it is very surprising that it is not more extensively planted, not only in sufficient quantity to meet home requirements, but also for export. The Castor-oil plant (*Ricinus communis*) is described as growing very luxuriantly, but it is not cultivated to any extent; some of the oil is, however, prepared and used in lamps.

WALL PLANTS AT THE SHEEN NURSERY.—If free habit of growth, combined with dense foliage that with little training makes a perfect wall-

covering, and along with this a profuse flowering disposition, constitutes a good wall-plant, why is it that the best of the Ceanothus are not more largely used for this purpose? Simply, we suppose, because they are insufficiently known. Such kinds as the old *C. azureus*, with its varieties, and *C. dentatus*, are common enough, but in the character of the flowers they produce they are nowhere beside some others, such as *C. Gloire de Versailles*, *C. Arnoldi*, and *C. Leon Simon*. These are in beautiful condition on Mr. KINGHORN'S house at the Sheen Nursery, blooming profusely every summer; their large spikes of flower, almost as big as an ordinary Lilac, hanging gracefully from the wall, give an effect for a lengthened period that few plants can afford. The first-named is the most decided shade of blue, *C. Arnoldi* is paler, *C. Leon Simon* has a greyer tint, but each is deserving of all that can be said of it. Associated are two such examples of *Clematis Jackmanni* and *C. rubella*. The latter charming variety loses in estimation through the unusual popularity of *Jackmanni*. Excellent in every way as this fine sort undoubtedly is, it has a worthy rival in *rubella*, the habit of which is similar, except that it flowers a little earlier than *Jackmanni*, thus prolonging the reason of bloom. Its splendid claret colour is most effective when in the luxuriance of Mr. KINGHORN'S example. Near these is a plant of the Oak-leaved *Hydrangea quercifolia*—not by any means common, but a distinct and effective species. With these is *Eleagnus marginatus aureus*, covering some 10 feet by 10 of wall. This plant is doubly valuable for wall covering, on account of the length of time the leaves retain their bright yellow variegation.

LATHYRUS SATIVUS (AZUREUS).—Why is it that this pretty blue annual Pea is not more grown? It is so easily cultivated, and supplies so many pretty blue flowers—flowers of an unusual hue of blue—that it can scarcely fail to be a favourite with gardeners who grow flowers for cutting from. The flowers are borne singly, and on fairly long slender stems as to be well adapted for buttonholes and other purposes. The blossoms, unlike those of the Sweet Pea, are destitute of fragrance; and yet they are blue in colour, and in this respect quite unlike any one of the Sweet Peas. This *Lathyrus* does well sown as an annual in the open ground.

THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 12, issued by the Meteorological Office, London:—The weather during this period has been dull, cold, and showery, while over England several thunderstorms have been experienced. The temperature has been below the mean in all districts, the deficit over central England being as much as 4°. The thermometer was generally highest on the 7th, when it rose to 69° at Ardrossan, Mullaghmore, and Geldston, and to between 65° and 68° at many other stations. On the 12th the maxima were below 60° in almost all parts of the kingdom, and at Nairn the temperature did not exceed 47°. The minima were as low as 37° at Silloth, 39° in the east of Scotland, the north-east of England, and the north of Ireland, and between 40° and 43° elsewhere. The rainfall has been more than the mean in all districts, the excess being greatest in the eastern and western parts of the country. Bright sunshine shows a considerable decrease in duration in Scotland, the north-west and east of England, and the west of Ireland; but elsewhere an increase is reported. The percentages ranged from 20 in "Scotland, E." to 44 in "Ireland, S.," and 53 in "England, S.W." Depressions observed:—During the first few days of this period pressure was highest over France, while a series of small depressions passed in an easterly direction over our more western and north-western coasts, causing moderate to fresh south-westerly to westerly winds. By the morning of the 7th, however, conditions had changed, and from that date till the close of the week the barometer was highest to the westward of Ireland, and lowest in the eastern part of our area. Northerly winds consequently prevailed at all our stations, and though moderate or fresh generally, increased to a gale at times in the north and east of Scotland.

GARDENING APPOINTMENTS.—Mr. A. HAMSHIRE, formerly Gardener to Sir W. H. SALTS, Bart., Naplewell, Loughborough, has been engaged as Gardener to E. COPE, Esq., Lenton Firs, Nottingham.—Mr. C. STURGES, Foreman to Mr. GILMAN of Ingestre, has been engaged as Gardener to J. YOUNG, Esq., Oakfield, near Gateshead.

RHODODENDRON FORTUNEI.

R. FORTUNEI has excited some discussion since it was shown at the Royal Horticultural Society's meeting the other day, and now it appears to be more commonly in cultivation than I supposed. The finest plant I have seen grows in Captain Rogers' garden at River Hill, Sevenoaks, on the north side of a wall, in which position it blooms fairly every year. The blossoms from that plant were first-rate. Mr. Farrant possesses a grand bush in the Isle of Man, he tells me, but I have not seen the flowers. Judging from his description, and the foliage, however, I should think his plant undoubtedly genuine; for it is well to caution purchasers that many shams are in circulation. As far as I know, the species has been twice introduced from China—first by Fortune (whose plants were sold at Stevens' in 1859), and secondly, and recently, by Maries, the collector for the Messrs. Veitch, who have very kindly given me plants of the second importation. For botanists much interest attaches to this species. Its occurrence in China, among Rhododendrons of a very different type, is curious and unexpected. Its resemblance in many respects to the distant *R. Griffithianum* of Sikkim is undoubted; but what distinguishes it from its neighbours, and from the Himalayan Rhododendrons, is the arrangement of the lobes of the corolla and the stamens in sevens. It appears to be a wild plant in China; otherwise one might have supposed it to be a result of cultural modification by the Chinese, who have probably been curious gardeners for thousands of years.

Information may possibly, however, be derived from another quarter. If we travel further east, we light upon a Rhododendron in Japan, *R. Metternichii*, which has not only the lobes of its corolla and its stamens, but also the divisions of the ovary, generally in sevens. (See Sieb. et Zucc., *Fl. Jap.*; Franchet et Savatier, *Enum. Plant. Jap.*; and Maxim., *Rhod. Asia Orientalis*.) This Rhododendron is very scarce, I fancy, and I have never seen the living plant; but, with the kind assistance of Mr. C. B. Clarke, I found the alleged arrangement in sevens verified by an examination of the specimen in the Kew herbarium. This plant has been confounded and compared with *R. maximum* of the North American continent, which fact suggests a very large and important botanical discussion, which I will not enter on. The principal object of this note is to ask your readers kindly to bear in mind my desire to see a living specimen of *R. Metternichii*, for the purpose of comparison, and, if possible, of experiment. Mr. Bull used to sell the plant, and Mr. Elwes has frequently mentioned it to me.

I have said that I was inclined to think that *R. Fortunei* might be, not a normal, but a cultivated form, possibly a hybrid, but the extreme potency of the pollen as applied to certain species (details of which I will give you later on) has not confirmed such a view. No one, however, ought to dogmatise on *R. Fortunei* without a full knowledge of *R. Metternichii*, which latter may itself be a manufactured form, for it is related to be a chief ornament of Japanese graveyards, and especially of the tombs of Japanese Emperors. It is very interesting to mention that Kempter, at the beginning of the last century, observed and recorded the division into seven of this flower. *J. H. Mangles, Valewood, Haslemere.*

PLANT PORTRAITS.

ÆRIDES LOEBI, Williams' *Orchid Album*, t. 21.—A form with very long dense flower-spikes, the flowers an inch or more in their longest diameter, segments ovate oblong, violet spotted, lip larger, somewhat three-lobed, white, with a central deep violet blotch.

ANGULOA RUCKERI SANGUINEA, *Orchid Album*, t. 19.—Flowers 4 inches in the longest diameter, hooded sepals and petals ovate acute, convex, creamy-yellow outside, deep blood-red within, lip 3-lobed, lateral lobes broadish, central lobe smaller, acute—all crimson. Native of Colombia. Hort. Boddaert.

BURLINGTONIA CANDIDA, *Orchid Album*, t. 18.—Flowers 2 inches in their longest diameter, segments broadly ovate acute, white, lip larger than the other segment, and with a central yellow stripe. Demerara. Hort. Williams.

CALANTHE VEITCHII, *Gard. Chron.* 1859, p. 1016; *Orchid Album*, t. 31.—A well-known winter-flowering Orchid, with lovely rose-coloured flowers. Garden hybrid.

HOME CORRESPONDENCE.

The Gardeners' Royal Benevolent Institution.—The Lord Mayor of London will preside at the 30th Anniversary Banquet on the 29th inst. During the time the Lord Mayor has been in office he has brought his influence to bear in every possible way to assist the various charitable institutions of this metropolis, and among others he has not forgotten the Gardeners' Royal Benevolent Institution, as the accompanying letter, which has been widely circulated, will show; and I trust it will have a very good result. My committee are using their best efforts to secure a success both socially and financially; and in their endeavours they are ably seconded by the following gentlemen, who are canvassing their friends to obtain subscriptions, viz.—E. J. Beale, Esq., Messrs. J. Carter & Co., High Holborn; George Bell, Esq., Messrs. J. & G. Bell, Covent Garden; James Boyd, Esq., Messrs. Boyd & Son, Paisley and London; George Neal, Esq., Messrs. Weeks & Co., Chelsea; Robert Hogg, Esq., LL.D., *Journal of Horticulture*; Edward Holmes, Esq., Whittington Nursery, Lichfield; Benjamin Maller, Esq., Burnt Ash Nursery, Lee, Kent; W. J. Nutting, Esq., Messrs. Nutting & Son, seed merchants, Barbican; Francis Robinson, Esq., Messrs. Dickson & Robinson, Manchester; E. W. Serpell, Esq., seed merchant, Plymouth; Nathaniel Sherwood, Esq., Messrs. Hurst & Son, Houndsditch; Charles Turner, Esq., Royal Nursery, Slough; B. S. Williams, Esq., Victoria Nursery, Holloway. The Court of the Fruiterers' Company, I have every reason to believe, will be fully represented. The Sheriffs have intimated to me their intention of being present, and I am informed that a number of foreign horticulturists will be visiting London at that time will also be present. Under these circumstances my committee have every reason to anticipate a successful meeting. But while the committee are thus working, should we not have the aid of those men for whom the Society is established? It is in their power to assist most materially, and that is by contributing, with the sanction of their employers, some fruit for the dessert. Experience has shown us that if the subject is brought before the notice of employers, permission would in nearly all cases be most readily given. I do trust that the gardeners will rally round the committee, and assist them to the best of their ability. *E. K. Cutler, Secretary.*

In my capacity of chief magistrate of the city of London, I have consented to preside at the ensuing anniversary of The Gardeners' Royal Benevolent Institution, to be held on the 29th inst., and I have done so with peculiar gratification, having been connected with the Institution for some years, and being much devoted to gardening pursuits. The Institution, which has for its object the relief of old and distressed gardeners (men that have in their younger days contributed very materially to our pleasure and enjoyment), I conscientiously recommend to your kind and earnest consideration. As the Chairman of the anniversary, I am naturally anxious that the interests of the Institution should not suffer in my hands, and I look with confidence to those who take pleasure and delight in their gardens for support and aid upon the occasion, and I trust to receive from the Secretary such a report as will prove to me that this appeal to your charity and sympathy has not been made in vain. Any communication addressed to the Secretary, 14, Tavistock Row, Covent Garden, W.C., will meet with prompt attention. *J. Whitaker Ellis, Lord Mayor of London.*

Seed Crops.—At p. 775 reference is made to the prospects of the Swede crop, and it is spoken of as likely to be poor, the plants having canker on the leaves. Middlesex is not usually classed amongst seed-growing districts, but near here there is growing in several patches some 25 acres of Swede seed, and I have never seen any so better. The grower (John Odell, of Biggleswade) has a large extent of land here under cultivation, and Swedes always form an important seed crop; but this year his crop is larger than usual. The bloom is fast disappearing, and the seed produce should be immense. I do not know what the kind is. Seed is sown early in the autumn, and the young plants are dibbled out at intervals of some 10 or 12 inches each way during open weather in the winter and early spring. The price paid for dibbling per acre is, I believe, 20s. As Mr. Odell cultivates market crops also he is thus enabled to vary the cropping of his soil more thoroughly than can be the case where seed crops are almost exclusively grown. A large breadth of that excellent Onion, the Bedfordshire Champion, is also grown,

and the seed crop from old bulbs promises this year to be an excellent one. Picklers are strong and thick. As Onions are doing so well this year, and so far little is heard of the Onion grub, which was so destructive last year, there is reason to hope that the crop will be remarkably good, but there has been quite enough of rain for these pickler breadths, and more may cause the bulbs to be large and coarse. Market Onions prove almost invariably a very remunerative crop. The soil must be well enriched with manure, but Potatoes may follow, and after that corn of some kind with that one dressing, and yet fine crops result. Many of our market gardeners vary their rotation only in Peas and green crops, and Potatoes and green crops, and it is not to be wondered at if in a few seasons complaints are rife that the soil is vegetable sick. *A. D.*

Conservatories and Hothouse Building.—The construction and quality of horticultural buildings ought to be of interest to all your readers, and I am pleased to see the remarks of "T. T." (p. 767) and his friend the builder (though I have no idea who either of them may be), but I should like to add a little thereto. While agreeing as to the scamping and his condemnation of the "contract system"—so far as that applies to the choosing of "the lowest of twenty-five tenders"—I would remind them that ninety-nine out of a hundred of the purchasers will have a contract and a quite right one. The effect of a gentleman leaving it to a tradesman to build just what is roughly described to him will generally be that a house expected to cost £100 turns out to be nearer £200, and so the next time anything of the kind is required he rushes to the other extreme of inviting a dozen firms to compete, with the result of "jerry work," even when he has employed an architect to prepare plans and specifications. It is not merely a question of the "skill and honesty" of the chosen tradesman—but is he used for this class of building? Horticultural building is a special and distinct thing, and it is scarcely possible to get "five-and-twenty tenders" from those engaged exclusively in the trade. The secret of the jerry building so justly complained of is getting outsiders to tender who are not trained to this work. There are always plenty of jobbing builders (especially in the suburbs of large cities) who will "undertake" anything from a cradle to a conservatory, and who, to secure the job, will quote a price that another would have to pay for materials only, trusting to "extras" to make up. Architects, too, are so seldom engaged in the details of this work that they do not know the class of timber best suited for hothouses, and will specify certain high-class deals used in dwelling-house work, which are as unsuitable for the purpose required as the common qualities patronised by the jerry builder, and will often describe or plan a method of construction equally useless for erecting work of this kind. I could fill pages with instances of what I say, but will only give two as specimens. Eleven years ago a London architect of good position called on a firm of horticultural builders with plans, and obtained tenders from them, but not liking the price or the deals in use at the works, thought he could do better and more cheaply himself. Four years ago he asked me to go and see his place, where I found men pulling down a rotten old conservatory, as I supposed, and pleasantly remarked, "It was time that came on." "Time?" he savagely rejoined, "that was only put up six years ago at greater expense than your firm estimated, as I selected all the timber myself from the yard and watched the whole construction of it." A few weeks subsequently I saw at a country-house a gentleman admiring some vineries he supposed were new (but only just repainted), which were built by the same firm thirteen years previously from same class of deals rejected by the architect. Last year four firms tendered for erecting a range of plain glasshouses—two outsiders, and two in the trade; one of the latter, having nothing else in hand, and to keep his trained men at work, put a specially low price, making sure of the contract, only to find that the builder of an adjoining dwelling-house was 12 per cent. lower; this was owing to his having his men and plant on the spot, and a quantity of timber left that would just cut up without waste. While that was progressing, plans were prepared for a conservatory of elaborate design, and an immense firm tendered privately; the result was that the previous lowest was now the highest, about £400 (it was difficult and special work he was not used to); three other outsiders were next in order; then three in the trade, between £240 and £215; the two lowest being £160 and £155 only! An extraordinary difference this, not easily to be accounted for. But it turned out that the £160 one had overlooked a certain item costing £55, while the lowest accepted price was from a firm of plain glasshouses, and was met in by the architect, and who had obtained from his clerk the lowest figure, and so sent in just below it. When the £160 man explained his error three days after, the other also claimed it next day as an oversight and got £50 more. This is one of the demoralising effects of the competition contract

CATTLEYA GUFFATA LEOPOLDI, Orchid Album, t. 16.—Racemes terminal, many flowered. Flowers nearly 4 inches across, orange-brown spotted with crimson, lip 3-lobed, the side lobes erect, rolled over the column, violet, the mid-lobe magenta-purple, stalked with a transversely oblong bilobed limb. South Brazil. Hort. Shaw.

CHERRIES, Florist, t. 558.—The varieties are:—1. Bedford Prolific, a seedling from Black Tartarian and much harder than it, but less highly flavoured; 2. Bigarreau Gros Cœur, an old Cherry, with fruit of large size, oblate spheroid.

CELOGYNE MASSANGREANA, Rehb.f., Gard. Chron., vol. x., p. 684; Orchid Album, t. 29.—Sepals and petals light buff, sides lobes of lip erect, yellow, central lobe roundish, spreading, smoky-brown, with a narrow creamy-white edge. Assam. Hort. Massange.

CYPRIPEDIL LAWRENCEANA, Orchid Album, t. 22; Rehb. f. in Gard. Chron., x., 748.—Flowers 4½ inches in longest diameter, upper segment broadly ovate acute, white, with broad purplish stripes along the veins, lateral segments strap-shaped, greenish, tipped with rose, and with several hairy warts on the ridges below the centre. Borneo. Hort. Pollet.

DENDROBIUM AINSWORTHII ROSEUM, Orchid Album, t. 20.—Flowers nearly 3½ inches in their longest diameter, sepals and petals tinted with magenta-rose, lip purplish-crimson.

DENDROBIUM SUAVISSIMUM, Orchid Album, t. 13.—Racemes many-flowered, flowers 2½ inches in diameter, golden-yellow, lip roundish, yellow, with a horse-shoe shaped purplish-brown blotch. Burmah. Hort. Williams.

LÆLIA ELEGANS ALBA, Orchid Album, t. 30.—Sepals and petals pure white, lateral lobes of lip erect, white, tipped with violet, central lobe spreading, wrinkled, rich violet. Hort. Williams.

LÆLIA PURPURATA WILLIAMSII, Orchid Album, t. 9–10.—Flowers very large, 4 inches in diameter, sepals and petals delicate rose, veined with a darker tint of the same colour, the lip is broad, yellow at the base, the fore part rich magenta. Coll. Baron Schroeder. S. Brazil.

LÆLIA XANTHINA, Orchid Album, t. 23.—Flowers 4 inches across, segments oblong, rich golden-yellow, lip trowel-shaped, yellow at the base, the fore-part flatish or recurved, white, with red stripes. Brazil. Hort. Williams.

MASEDEVALIA HARRYANA COERULESCENS, Orchid Album, t. 24.—Flowers 6 inches across, upper segment narrow linear, lower deflexed, broadly oblong, magenta-crimson. New Granada. Hort. Percival.

ONCIDIUM GARDNERI, Orchid Album, t. 12.—Flowers panicle, segments yellow, thickly mottled with brown, lip transversely oblong, bright yellow, with a marginal line of brown spots. Brazil. Coll. Vanner.

ONCIDIUM HEMATOCHILUM, Orchid Album, t. 32.—Panicles many-flowered; flowers 1½ inch in diameter, outer segments ovate oblong, greenish, with brown bars, side lobes of lip short, violet, central lobe stalked, transversely oblong, brownish-purple, edged with yellow.

PSEUDOCYBE KLABOCHORUM, Orchid Album, t. 17.—Flowers 3 inches in the longest diameter, segments oblong acute, white deeply tipped with magenta, lip trowel-shaped, its disc covered with styliform papillae, and marked near the base by a vertical frill. Ecuador. Hort. Williams.

PHALÆNOPSIS AMABILIS DAYANA, Orchid Album, t. 11.—The sepals and petals are pure white, the lip is marked with yellow blotches, and reddish-crimson spots and bars. Malaya. Coll. Lee.

RHIZOPHILA SUAVIS ALBA, Orchid Album, t. 14.—Flowers racemose, 4 inches across, with narrow white segments and a large trowel-shaped obtuse lip, with a few yellow stripes at the base. Central America. Coll. Boddart, Ghent.

VANDA PARISHII, Orchid Album, t. 15.—Racemes many flowered, flowers 2½ inches across, yellow, with brown spots, lip smaller than the other segment, violet. Burmah. Coll. Chamberlain.

VIOLA ALTAICA, Gartenflora, t. 1071.—One of the parents of the garden pansy, the other being *V. tricolor*; blue-yellow and white forms are figured. A beautiful hardy perennial, which we should be glad to see more frequently.

WISTARIA SINENSIS FLORE-PLENO, Florist, p. 557.—The double-flowered variety of this lovely hardy creeper. It was introduced from Japan. Hort. A. Waterer.

system. What course, then, is the intending purchaser to adopt between accepting the lowest competitive tender and giving *carte-blanc* to a tradesman? Is he may not feel himself compelled to decide whether a price is really high, or too low for a good article. I show, say, several particulars as possible of what is wanted to two or three recognised house builders who confine themselves to horticultural work, and ask their prices without informing each that another has been applied to, but giving an idea of the amount to be spent if it is limited, and then choose from estimates or sketches submitted. It is astonishing that gentlemen will not see that a professed horticultural engineer, who has spent the greater part of his life in this work, must be more competent, and, in the end, more economical, than a local "Jack-of-all-trades," who, after all, has to send to the despised London for most of his material, paying a higher price for the small quantity he wants (and its carriage), besides a great amount of time in writing or travelling specially to get it. One reason for the vast number of flimsy greenhouses is the fact of the purchaser having only a seven years' lease, but must have "something at your very lowest price" to put his plants in, not caring what the thing falls to in the next couple of years. Another is, that the "speculating" builder finds that a conservatory (save the mark!) will enable him to sell the house (and its buyer) for £50 to £100 more, while costing him only one-fourth that sum by using up the cuttings from his house timbers, and adding some bits of coloured glass and curious tints of paint to make it look pretty in the ladies' eyes. In country places and old gardens where these reasons do not apply, it is the fact of getting a London firm in, judging that everything from there must be extra cheap because, forsooth, they advertise, and that a local man must be cheaper with the gardener's advice to keep him straight. Recently, a gentleman 50 miles away had a greenhouse erected for £180, which he thought decidedly reasonable, as the men had been at it over twelve weeks; but as he wanted a larger one built, a knowing friend induced him to describe the house to a London firm, and ask price and time required. The reply was £152, and five weeks' time, and yet I doubt whether the London man would get as good a profit as the London one, because he was not used to it, and spent all his time putting up to pull down again, altering here and starting there, for want of proper setting-out at the start. I must, however, if you please, refer to one thing that deters many from applying to firms that advertise, and that is the false—well, say misstatements in the advertisements of some people. I am reminded of this by the remark, that if none of the patent joints are air-tight, and yet I read that one system "takes less heating power than the old system;" at the same time "full play is allowed for expansion and contraction"—self-evident contradictions in the case alluded to. Another advertised, "100 per cent. saved in repairs;" not content with the 80 per cent. claimed by a rival; another, that "no painting is required;" another, giving ridiculously low prices, says, they are "glazed complete," but the glass is set loose, and even so. "T. S." says "the only system of [good] glazing without putty is the old English lead glazing, which is not applicable to horticultural buildings;" but at the implement exhibition now on at the Horticultural Gardens may be seen a little greenhouse so glazed, one of many similar ones, and, if all the Press reporters are right, it received the only award for glazing; at any rate its exhibitor is down for the only medal in that class. Z.

The Fruit Prospects in East Anglia.—I hope other counties have been more fortunate, but in this neighbourhood the fair, full promise of abundance is left but a mere skeleton of embryo fruits on Apples, Pears, and Plums. This is most unfortunate, because, after all, are the three most valuable fruits of the season. Peaches, Nectarines, Apricots, and Cherries promise a full crop. Though late, Cherries are as yet more or less uncatenated, many of them having fallen during the late droughts and trying east winds. Still, on the whole, Cherries promise to be a full crop. Small fruits, as they are called—Gooseberries, Currants, and Raspberries—are a capital crop. Strawberries are a little uneven, but on the whole, a good crop. The almost complete failure of the Apple, Pear, and Plum crop is the more provoking, as it can hardly be attributed to any extreme severities of weather. Drought, east wind, and a plague of maggots seem to have been the more potent causes of failure. Seldom has so good and full a promise been more provokingly wrecked by what seems to me inadequate causes. And, writing broadly, these three fruit crops are gone, and in place of them, but of fruit we have, on the Apple especially, quasi forests of skeleton trees. Plums and Pears can hardly be said to have failed through any plague of insects. The trees are tolerably clean and healthy, but of fruit there is little or none. Plums, that promised to be the great fruit crop of the season 1882, are nowhere. The Gages, which were as white as a sheet with bloom, are well-nigh fruitless. In reference to my last report on fruit

prospects, I will endeavour in future never to prophesy unless I know. Seldom has the disparity between prophecy or promise and fulfilment been more widely and disastrously divergent than this year. D. T. Fish.

Fruit Prospects in Yorkshire.—We have now arrived at that period of the year when we can ascertain with tolerable accuracy the actual state of the fruit crops. I regret I can only report unfavourably of them. Notwithstanding the prospects of fair fruit crops were rather promising in the early part of spring, the fruit crops of 1882, here and in this neighbourhood, are the worst there have been for some years. Plums were early in bloom, and the great profusion of bloom led many to think the crop would be a heavy one, but with the exception of some Victorias, and a few of the common kinds, there is very little fruit, and the trees have been covered with insects. The late heavy rains cleaned them a good deal. Pear trees showed a fair amount of blossom, but very much of it was small, weak and imperfect, and fell off without setting. The crop is a complete failure, or nearly so; standards, pyramids, and wall trees are alike—there is very little fruit on any of them. Cherries had a great abundance of blossom, but the crop is light, and some of the trees have suffered from caterpillars. The Apple crop is a light one, notwithstanding there was a good deal of blossom. Some trees here that had but little fruit last year have a fair crop, but the greater part of the trees have very little or no fruit. Apricots, when the trees are good, are a fair crop. Peaches a moderate crop, when the trees are healthy; Gooseberries, which promised to be a heavy crop, are very light in general. Black Currants are very light, and the trees have suffered from frosts, cold winds, and insects. Strawberries are looking well everywhere, and promise to be fine and abundant. Taken altogether the fruit crops of 1882 are very discouraging, more especially after the bad crops of the last four years. M. Saul, *Stourton, Yorkshire.*

Improved Fence.—The engraving (fig. 124) shows a novel fence lately patented by Mr. Levis

FIG. 124.—SELF-SUPPORTING FENCE.

McNall, of Allegany, N.V. It is an improvement in self-supporting wooden fences, and requires no posts set in the earth. The independent panels are connected so that they may be readily detached one from the other. Each panel is composed of three vertical parallel posts, two longitudinal rails, one at the top and the other at the bottom, and two boards attached to the posts between the rails. The rails are made sufficiently thick to ensure the strength and rigidity of the panels, and have three mortises for receiving the posts, which are secured in the mortises by means of wedges. The panels are set zig-zag, like a rail fence, and the ends are secured together by pins passing through holes in the projecting ends of the top and bottom rails of each panel. It will be seen that this fence is entirely self-supporting, and that the expense and trouble of digging post holes are entirely avoided. *Scientific American.*

Potatos: Autumn and Spring Planting.—Reports of the "flower shows" give me long-span-out, and crack-jaw names of all the floral exhibits, explaining away so-and-so's wonderful culture to the utmost; tolerable information about the fruit and vegetables, but much foreshortened information in regard to the Potato, that it would be impossible to curtail "So-and-so exhibited round, and 'other kidneys, and the biggest won!" or in other words to that short effect. I made an apology I remember in the last recondite composition I sent you, excusing myself, as it was only about Potatos; but you did not print it. An old friend of mine—he seldom writes about Potatos now—some fifteen years ago advised me not to allow myself to appear in print again. "For," said he, "at the end of ten years such subjects become exhausted, and one merges into a mere *caecætes scribendi*." He still continues to fill long spaces in your columns! and I am more deeply involved than ever in trying to keep ahead in the march of progress of our noble tuber. I find it, too, a much harder task at the present day than it was between thirty and forty years ago. Well, the young ones do not like to be told that they

are rising from the old one's shoulders. But practically, in regard to myself, I am run to the end of my tether; and the Potato is not now in existence that I could cross my seedlings with to give me better results in improving breed and flavour, and I will add crop. I could easily gain size, but not worth an otherwise, I think, the result of "in-and-in" crossing would prove. At this time of the year the chief part of the study in raising new seedlings is feature, and this can now be well learnt in the trial farm of our enterprising Reading firm—the Messrs. Sutton & Sons. There is a long parallelogram of Potatos planted the middle of last November, with an opposing spring-planted plot of the same length, having two rows of the same varieties exactly opposite each other. Many years ago I contracted this autumn-planting plan, and gave the results through the horticultural Press against it; the late Rev. W. F. Kadclyffe entered into the trials at the same periods, and his opinion proved the same. Here, at the Messrs. Sutton's, the spring-planted tubers have certainly won the day. The majority of those autumn-planted bear a premature stunted look, Sutton's Early Border only showing equality in robustness of haulm with its spring-planted counterpart. Fenn's Graf Hybrid gives evenness and the peculiar autumnal ripeness of foliage, and so do many of the others, without the evenness, but "gappy," and decidedly unpromising comparatively with those spring-planted. The Messrs. Sutton deserve the thanks of the public for this *exposé* of autumn-planted Potatos. I think it sufficient to settle the question forever; but we will wait for the digging and the result of the crop to come. When in haulms can look better and more promising than those which were planted in the first week in April. Amongst the large number of varieties grown to be proven and upon trial for merchandise, I have singled out some of the newest varieties which appeared to me to be most worthy of notice, with names ad without, viz., Early Cluster, Cosmopolitan, Crump's Seedlings; Anneford's Potato, a seedling from Wrexham; Golden Multiplier, Albert Edward, sport from Rector; Lady's Fingert, a sport from the latter, and Clive's No. 2 (both seedlings crossed from Magnum Bonum and Woodstock Kidney). A gentleman has sent to the firm natural seedlings from Woodstock Kidney, curiously "harking back" into types of many of my old crosses. Others send Snowflake-looking seedlings, "a seedling of a deeper colour than Bountiful," a red round seedling, Emerton's Advance, a red Potato from Belfast, Empress, "a beautiful white round, but miffy;" Ross's Magne, Dux, and Sir Walter Raleigh, Gaius's Seedling, Princess, Beatrice, Barlow's Seedling, Pomme de Terre No. 9, a seedling from France; Dean's Early Purple, Wheeler's Safeguard, White Mountain, Queen of the Valley, American Magnam Bonum, Early Vectis (a very dwarf type of Ashleaf), Fenn's new white kidney, Prizetaker, Standard, Sutton's First and Best, Filbasket, Rev. W. F. Kadclyffe, Worthington G. Smith, Fitzfloyd, Reading Russet, Fenn's Early, and the latter, Fenn's Annie, Argonistis, Improved Bountiful, &c. These are American seedlings, and if they turn out like most of their predecessors we may have to exclaim "Handsome is as handsome does." Other parallelograms of ground are in vicinity for testing the samples from the different growers. It is curious to witness the strength that some sorts have over others of the same variety coming from different counties and soils, those from Islip, in Oxfordshire, showing remarkable extra robustness. Again, there are squares of some one hundred new or popular varieties, a peck of seed being devoted to each square; these will appear by-and-by very instructive. And again skirting the Great Western Railway are plots of ground planted with bushels of tubers, in varieties, an inspection of which causes me to exclaim, "I do not know, and I do not suppose a Potato connoisseur could visit any trial ground where he could gain more instruction in this particular, and let me add any other researches in the ways of seed growing, than in the trial grounds of the Messrs. Sutton." These visits always afford a great treat to me, and the few cursory observations I have now been led to make I propose to be a mere preliminary to a severer scrutiny of my favourite esculent to follow. Opposite the Messrs. Sutton's grounds stands the well-known entrance to the Royal Agricultural Society's show grounds, which now affords a busy scene in its career of progress—wards completion. I think the Royal Agricultural Society may be congratulated this year upon their site. *Robert Fenn, Cottage Farm, Sulhamstead Abbotts, Reading, June 10.*

Bedding-out.—Some hints were recently given on bedding-out, and the effect that might be produced by certain combinations and admixtures of plants, and a very good one is that of Abutilon Thomsoni and Salvia patens, which blend splendidly, the lovely deep blue of the flowers of the latter showing up in the most pleasing contrast with a beautifully soft yellow spotted leaves of the former. To give the Salvia fair

room to respond and send up its spikes of bloom, the Abutilons should be planted thickly, and the *Salvia* dotted regularly over the ground amongst them, and if the branches of the Abutilon are pegged down a bit the *Salvia* will be able to push its way well up above them. Another mixture almost if not quite as telling, is that of the above-named Abutilon and *Verbena venosa*, as the latter, being of spare habit and having tall wiry stems, distributes itself thinly over the bed, and quite lightens it up with the many soft coloured heads of blooms which it bears. The Abutilon itself may be used in a variety of ways, and asson-ingly well with the deep copper leaves of *Ricinus Gibsoni*, with which it may either be mixed or planted as an edging, and the same with the dark foliaged *Cannas*, but being of similar form to the *Ricinus*, the Abutilon looks most at home in its company. Dotted here and there in the shrubbery or herbaceous border in the foreground of *Delpiniams*, equally well with the very striking, and forms a noble object of itself in the autumn, by which time it attains a respectable size, as in good soil it is of very quick growth. The thing in grouping or mixing plants is to make choice of those of kindred character, and so arrange them that there is no stiffness, and in a way that they look normal, which they will if their habit is similar, as may be seen when Palms and Ferns and such like foliaged plants are brought together, with which there is no incongruity. *7. S.*

Lycnis vespertina, fl.-pl.—While admitting the difficulty of propagating successfully this still rare old-fashioned plant, which Mr. Dod alludes to p. 746, I would say that he has been misinformed respecting its propagation being confined to foreign sources, since I propagated nearly one hundred plants of it last year. It is by no means readily increased, however; much patience is requisite, and in many cases that patience is not substantially rewarded. Spring is the best time. Where strong plants exist in the open ground (which by the way is not an everyday occurrence), select some of the strongest shoots to peg down, when they will produce young shoots from each joint; when they are about 2 inches long strip them off by the heel, and without dressing the cuttings in any way insert them in pots in the ordinary way, then place them in a cold frame or under a handlight for seven days or so, when they may be introduced into very gentle warmth, under which influence the cuttings will soon commence to grow. When of sufficient length the tops may be taken off, and inserted in other cuttings-pots, taking care to cut off close to the joint; these generally root in about three weeks or a month if carefully attended to—the original cuttings taking much longer. Should Mr. Dod's plants be small ones, I would advise his planting them out in good rich loam, when they will soon push into vigorous growth; if the plants can be covered with a hand-light so much the better, young slender cuttings will soon be produced. To those who may perchance have the clumps of this plant I would say, lift them in October or November, and strip off from the rootstock all available shoots, and stick out under a hand-light; these will root by the following spring, and always make good plants. I have also tried this from layers and root cuttings, but without success; in the case of the layers they generally callus readily, but afterwards canker and decay; the root cuttings usually retain vitality for several months, and then turn black. The synonymous name for this *Lycnis*, viz., *L. dioica*, is used by nurserymen for *L. diurna*, syn. *L. sylvestris*. I have never found *L. dioica* with red flowers in a wild state, and should be glad to learn if any correspondent of the *Gardeners' Chronicle* has. *L. vespertina* generally inhabits cornfields, and seems to all outward appearances distinct, and does not commence flowering as a rule till July; while *L. diurna* flowers early in May, and does not grow as tall by some 13 inches as the first-named plant, the general habit of each being most distinct. I should be glad of an expression of opinion on this point. *E. Fenkins.*

Flora Danica Dinner Service.—There is now being exhibited in one of the courts of the South Kensington Museum, an admirable collection of objects illustrative of Scandinavian antiquities and art from barbaric almost down to the present times. The examples illustrating the newer stone age and the ancient bronze and iron periods are very remarkable, and as regards the first (which are reproductions) nothing comparable with has probably ever been seen in Britain. The whole of the exhibition is extremely valuable and instructive. Amongst objects of recent date is a dinner service of seventy-six pieces, of the Danish (Copenhagen) porcelain from Rosenborg, painted (says the label) with the "floral forms" of Denmark, and known as the "Flora Danica Service." The different pieces, some being very large, bear painted reproductions from the famous coloured plates of the *Flora Danica*, and inside, or underneath each piece, the name of the plant represented is painted, with a reference to the volume and number of the plate.

A remarkable thing is, that the dissections of the flowers are painted as well as the general habit, and such scraps as a calyx, corolla, pod, or even seed are given. Large roots are in several places painted. Not only are flowering plants reproduced, but Mosses, tails, seaweeds, Liverworts, and even fungi, are given on this service. A centre piece is a basket containing a large group of well-modelled and painted flowers. The service is very handsome, and contains some curious pieces and curious subjects; but there are curious people, it is clear, even amongst botanists and horticulturists. One plate, possibly for dessert (say *Blan. mange*), has a large lump of slimy dry-rot most lovingly painted; a gray-boat has a piece of rotten wood with several sticky fungus attached, cleverly portrayed at the bottom; another plate has a very "loud" group of the venomous *Agaricus fascicularis* painted to the life, the moist tops and poisonous green gills being cleverly reproduced. *W. G. S.*

New Vegetables.—In my opinion enough of justice is not done to these. At many shows we find prizes given for the best seedling fruit or plant, but I know of no instance where a prize was either offered for or awarded to a new vegetable. Special shows, such as the International Potato one, do sometimes offer prizes for seedlings; but the greatest gatherings, such as our International Horticultural Shows, do not give the slightest attention to the subject. No doubt the greatest event of this year will be the International Show at Edinburgh, and here £7 is offered for "Seedling Grapes not in commerce," but not a half-penny is offered for any seedling vegetables. No one, of course, can object to this liberality, but why confine prizes of the kind to Grapes? There are many other products of our gardens, the improvement and introduction of which would benefit the general public far more than Grapes, and would it not be well to encourage their production and exhibition of such? New plants not in commerce have frequently their classes, but good useful every-day vegetables, in which everybody is interested, are kept in obscurity. True, they may always be exhibited at shows, "for the opinion of the judges," but in cases of the kind they are seldom acknowledged according to their merits, being generally placed in the odd corner, to be hurriedly looked at after all else is judged. If a special class were devoted to them this would not be so, and I would respectfully suggest the introduction of a separate class and good prizes for any new vegetable not in commerce at all shows of any importance. I am glad to see from your advertising columns that Mr. Gilbert and others are going to have a show of seedling Potatoes, and I hope that they or others will give this matter their attention and support. If it is not too late to introduce a "new vegetable" class at Edinburgh, I venture to assert that it would be both well filled and highly interesting. *7. Muir, Margam.*

Stephanotis floribunda.—In your issue of June 3 I noticed remarks on a *Stephanotis* with seven segments to the corolla. We have here a plant which has flowers with seven and eight, and it has flowered three years true to character. It is unfortunately over now, or I would have sent you a truss. *H. Howard, Castle Malvern Gardens.*

Honey-Dew.—Bee-keepers will rejoice greatly at what they regard as honey-dew, the deposit of which is very heavy this year, as aphids are more than usually prevalent, the undersides of the leaves of Limes, Sycamores, Cherries, and most other trees, being quite covered with them, and, as a natural consequence, the foliage below is heavily coated with their excreta, which they exude in such quantity as to form a glutinous paste, and varnish the leaves quite over. Many look on this so-called honey-dew as a sort of distilled sweetness brought down from the atmosphere by the influence, and never dream of aphids, or think it of no discharge from any insect, else they would not be found, as I have seen them, licking the nectar off, and appearing to enjoy it, till they knew from what source it came, when they soon showed disgust, and a violent fit of expectorating seized them. Hop-growers, and those connected with gardening, know only too well what honey-dew means, and when they see it are well aware that the enemy is at work, and the vital energies of the plants, and crippling the growth. What is wanted now is a good down-pour of rain to wash the foliage, and cleanse it of the parasites and honey-dew; for though the latter may be good for the bees, and go far towards assisting them to fill their hives with honey, it stops the pores of the leaves, and prevents free respiration, and thus interferes with their health. Whether extra electricity in the air has anything to do with the destruction of aphids I know not, but I have often noticed, immediately after a thunder-storm, whether accompanied by much rain or not, that trees are much free from them; and it would appear, therefore, that in some way it brings about their destruction. *7. Steppard.*

ROSES AT THE OLD NURSERIES, CHESHUNT.—Seasons are few and far between when there would be much to say about Roses at the end of May, unless the observations were confined to the appearance of the tender shoots and leaves. But this remarkable spring, Roses, and not a few, were in bloom; whole rows of some kinds, on the Manetti stock, were sufficiently out to give a forecast of what the season's flowers promise to be. As a matter of course, there is the most interest attached to the newer kinds, particularly those that have come out within the last year or two, and which have not yet been fully proved. Amongst those that are evidently early bloomers is Madame Montet, a beautiful warm pink, with enormous shell-like petals, measuring near upon 23 inches wide by 2 inches deep, most lovely in the half-petalled flowers; Guillaume Gillemot, bright rose-carmine—this will also be an early sort, and, as here seen, promises well—it is a big flower, with very large even petals, extremely vigorous, the foliage unusually large, some of the shoots so early had reached 4 feet in height; Alfred Dumesnil, an even cupped Rose with good petals, carmine, with a violet shade. Catherine Souper, a rose-peach Jules Margottin, is very handsome and extremely vigorous. The Tea-scented Madame Chedane Guinoissaine is lovely in the bud state, deep lemon-coloured. Glory of Cheshunt is here the earliest of the red Roses, and well maintains all that has been said of this fine variety. Of this year's new Roses may be named May Paul, Tea-scented, which bids fair to be a fine addition to the class to which it belongs—climbers of the Gloire de Dijon type, the outsides of the petals are red, paler inside. If it turns out as free in growth and flowering as Gloire de Dijon it will be everybody's Rose. Etiole de Lyon, a beautiful yellow Tea, not unlike *Etiole Sauvage*, but a strong grower. *Violette Bouyer*, H.P., white, with the slightest dash of flesh colour when open, will be liked by the Rose loving public. Madame Jules Grey, H.P., delicate peach-colour petals like La France. White Baroness: this sort quite maintains the high character first formed of it, as free from the defect in Mabel Morrison not coming full enough. Regarding new Roses, Mr. Paul is not by any means in a rest-and-be-thankful mood, as the long bed, with hundreds of this year's seedlings that are now well above-ground, testifies; amongst them it is not expecting too much to look forward to yet more that will gladden the growers of this universally favourite flower.

In the sheltered nook far from Mr. Paul's house, almost wholly occupied by Tea Roses, with a shelter line of cordon Pears surrounding, the Roses have now had raised beds prepared for them, and are in a most vigorous condition, many being already in flower. The mild winter, succeeded by a spring which has given them no check, has favoured healthy early growth. The beds have deep alleys between them, like the old method of growing Asparagus, the object on this strong soil being to keep them as dry in the winter as possible; a selection of all the best Teas are here planted. By the way, the Pears on the cordon, which include most of the best kinds, have set such a crop as to require quantities thinning off—a state of matters that, we fear, will not occur in many places this season. Nothing finer could be wished for than the appearance of the Roses collectively, which only require a continuance of favourable weather to give a remarkable bloom. The influence of the Manetti stock in exciting early growth is this season to be seen at Cheshunt more than usual; most of the newer sections of Roses are grown in two rows side by side, one on the Manetti and the other on the Dog, the former in every case being near upon a fortnight earlier. This is a gain from a general garden point of view, in so far lengthening the Rose season in localities where early growth is not liable to be injured. In places more than ordinarily subject to spring frosts, it points to the non-desirability of using the Manetti.

A collection has been brought together of two very interesting descriptions of Roses, including all the

striped kinds, of which the old York and Lancaster is best known; and also of the most distinct single varieties, which have a refined beauty of their own, and will doubtless be admired and grown by many who now can see beauty in a flower although it may not be double, and whose ideas are not so far fixed as to look on the admission of single Roses to careful cultivation as either a want of taste or inability to appreciate the work that has been done by those whose patience and perseverance has brought the Rose, as now approved, up to its unquestionable standard of excellence.

Notices of Books.

The Agricultural Depression and How to Meet It. By Alfred J. Burrows. 1882. Reprinted from the *Journal of Forestry and Estates Management*. London: William Rider & Son.

Our contemporary, the *Journal of Forestry*, has enlarged its plan. It is now a *Magazine about Trees and all Subjects connected with the Management of Estates and Rural Life*, and the present volume, by a Kentish land steward, reprinted from its pages, is a good omen of success, being a thoroughly practical volume, full of concisely written information on farming subjects. The table of contents includes tithes, rents, pastures *versus* corn growing, high farming of arable lands, increased production, middlemen, stock, market garden and fruit growing, tenant-right, &c., and all the other familiar topics which make up the sum total of what is called the "agricultural question." All these subjects are treated with much intelligence and sound sense, as, for example, in the essay on "Small Farms and Peasant Proprietors," the science and machinery of the large farmer are relied on for England rather than the spade of the little freeholders; and at the same time the merits of small holdings, when cultivated after the manner of market gardens, as in some parts of this and other countries, are admitted. The author is unbiased, and has the rare merit of showing more care for presenting to his readers knowledge and facts than for indoctrinating them with a particular theory, even when dealing with such vexed questions as the land laws and the tenure of land. Most of us lean in sympathy towards that admirable person who conserves and strengthens—*the small proprietor*; and Mr. Burrows remarks that the enormous growth of kitchen garden produce in France is rendered possible by the subdivision of the land. It is certainly rendered impossible here by the system of large farming, and it is a question of much interest to what extent an improved diet, including more "vegetables," and, we may add, more milk and more of the minor products of agriculture, might be encouraged by the growth of small farming.

Mr. Richardson says, in his work on the rural economy of France, "It is clear that these small holdings, worked by a man's own family, do pay; and considering how largely agriculture is likely to become an affair of kitchen gardening, will continue to pay more and more. The growth of kitchen garden and fruit produce in France is so large that it quite ceases to be in the category of small undertakings; the returns of 1873 show that a million and a quarter of acres grow green vegetables." Here, too, the minor products would be best attended to by small farmers and their families, and we, like Mr. Burrows, have no fear of the uniformity which the prevalence of that class, or any other class, would establish. We expect to see it increase simply because it can, when training and education are not wanting, grow some things more cheaply than they can be produced by large farmers. We cannot vie with France in some products. As Mr. Richardson points out, the Grapes of Thomery, the Broccoli of Roscoff, the Asparagus of Argenteuil, the Melons of Vaucluse, where 8000 grow on every acre, are found in their season in all the capitals of Europe. The sun does more for France than for us, but we can beat the world, Mr. Burrows thinks, in Gooseberries, Osier-growing, and basket-making, and also in the manufacture of jam.

Some Kentish gentlemen have resolved lately on making jam in factories of their own, and whether they succeed or not (and that will depend solely on management) there is no doubt the Kentish growers already excel in small fruits. *Small Farms and Fruit Growing*, formed the subject of a little work by a clergyman, the Rev. William Lea,

who grew the following weights on two acres, and hopes to do better:—

Green Gooseberries	lb.	2,497
Black Currants	1,603	
Coloured Plums	2,710	
Pershire Egg Plums	6,972	
Strawberries	359	
Apples	830	
Pears	674	
Quinces and Medlars	59	
Filberts	47	
Total produce of two acres	15,047	

As Mr. Burrows observes, in these days of enormous jam manufactories nothing need be lost of the produce of fruit gardens, even windfalls may be utilised. Our author gives abundant reasons for reliance on self-help in agricultural as in other practical affairs, and, for the sake of the very large amount of information his book conveys on the methods of improved culture, we cordially recommend it. In other departments which we have not noticed—such as the improved breeding and management of live stock, and the better cultivation both of arable land and pastures—Mr. Burrows enters the special province of the large farmer, the grazier of Northamptonshire, or corn grower of the Eastern Counties or other districts. He tells us, for example, of an improved breed of sheep which gave an average increase from birth of 4 lb. of mutton per week each up to forty weeks old—a maximum result no doubt; but one which stock farmers may aim at, nevertheless, both in the production of beef and mutton, remembering, moreover, the adage that "the more meat the more corn," on arable land. Examples are also given of the profits of pasture as well as arable, and of the kinds of soil adapted for each. The author never suffers from prejudice, and is, therefore, able to explain the rationale of particular systems, and to discuss such subjects as tenant-right or local taxation without exaggeration. It is hardly necessary to add that he recognises the causes of depression, and while giving a "proper place to every sound plan of improvement, political or practical, he acknowledges that "genial seasons, more than all other causes, must be relied on to restore prosperity."

The Crops of the Farm.

This is one of the series of real Handbooks of the Farm now in course of publication by Messrs. Bradbury, Agnew & Co., under the general editorship of Mr. J. C. Morton. The titles of the chapters will suffice to show the scope of the work. They are devoted to (1) Permanent pasture, (2) Rotation of crops, (3) Grain crops, (4) Root crops, (5) Forage crops, (6) Lying down land to permanent pasture, (7) Exceptional crops, (8) Weeds. We are glad to see that the practice of the market gardener is held up for imitation. By superior tillage, abundance of manure, and plentiful labour, he gets many crops off the same land within the year, paying but one annual rental. Of course the circumstances and conditions of the farmer are often different, still the general principle followed by the market gardener is one which the farmer should endeavour to adapt to his exigencies. There is room also for more progressive improvement in the hybridisation and selection of cereals and other farm crops. Every farmer should have his own trial ground for experimental purposes, and he should learn to be wary of those monstrous roots which seedsmen display at their exhibition stands; they are for display at exhibitions rather than for practical utility. This is a thoroughly practical little book, which may be confidently recommended.

— *The Laboratory Guide*.—We are glad to notice the fifth edition of this very clear and useful work, by Professor Church. Though intended primarily for agricultural students, it is perfectly well adapted for horticultural students also, and, indeed, forms an excellent introduction to practical chemistry for any class of students. Mr. Van Voorst is the publisher.

— *The Journal of Forestry* for June appears under new editorship, viz., that of Mr. Francis George Heath, who succeeds to a task of great responsibility, the editorship of his anonymous predecessor having been so uniformly good. We are glad to learn that the character of the *Journal* is not to be altered. A valuable table in the present number gives the prices realised per cubic foot of various kinds of timber in several of the counties of England and Scotland in the season 1881-1882.

Florists' Flowers.

SEASONABLE NOTES: AMARYLLIS.—The very latest to bloom of these are now over, but the Amaryllis more than many other bulbous plants must not be neglected when the flowering season has passed. If any seeds have been saved they will also be ripe, and should be sown immediately. In the first place, as to the old plants, keep them in a temperature of 65° at night, and if they can be afforded a bottom-heat of 85° that will help to stimulate root action, for the plants now make plenty of roots. The leaves are also sometimes attacked by thrips, but they must be cleaned by washing them or fumigating the house. If the plants are grown on freely for two months longer the bulbs will become very much larger, and will be matured so that they will be sure to flower well the following seasons. The young seedlings soon appear above-ground after the seeds are sown, and when the plants have made some growth they should be pricked off into other pots, and still keep them growing on gently during the autumn and following winter, as the object is to get them into bloom as soon as possible. The plants, even when not in flower, do not like too much exposure to the sun, and should be shaded in hot weather.

AVALEAS.—The early-flowering plants should now be pushed on in a high temperature and rather moist atmosphere, so that the flower-buds may be formed at an early date. They should also be placed in a light house, and not be crowded too closely together, because if the young wood has to be formed where it does not get sufficient light and air it will not develop a plentiful crop of large well-formed flowers next season. As other plants go out of bloom remove the decayed flowers and seed-pods at once, as they have a tendency to exhaust the plants. They should also be removed to a forcing-house to make their growth, if it is possible to do so. Sometimes it is possible to keep the greenhouse a little warmer, and also to syringe Azaleas and Camellias when they are making their growth. See that the plants are kept free from thrips and red-spider. If they are clean the syringing helps to keep them so, but if they are infested with insects they must be dipped in a tobacco-water solution. If any plants are to be kept as late as possible for any purpose they should be placed in a late house, and have plenty of air admitted. There are late sorts that, with good management, may be flowered in July.

CINERARIAS.—These plants do not like the hot weather in June and two following months. I find the best place for them is in a cold frame, or a pit with a north aspect. The plants intended to flower early should have been potted off some time ago; ours are good-sized plants in large 60's. They will soon want potting off in good soil, of which a fourth should be rotten cow-manure and as much leaf-mould. Greenfly is very troublesome during hot weather, but it should be destroyed at once. Thrips also attack the leaves; fumigating with tobacco-smoke is the best way to destroy both of them. Propagate stock of all that it is intended to perpetuate in that way. Some of the new double varieties are greatly admired, and the new single varieties raised by Mr. Cannell, of Swanley, have carried us very much forward in the path of progress. The named varieties can readily be increased by cuttings or offsets from the base of the old stems; they should now be put in round the sides of small pots, using fine sandy soil to pot them in.

FELARGONIUMS.—The show section of these should now be in full beauty, and no other plant is so easily grown, and at the same time so well adapted to furnish the greenhouse and conservatory with beautiful flowers. If the plants have been kept free from greenfly up to the time of flowering they will not suffer from its attacks until the bloom is over, when they can be removed out-of-doors to be ripened off preparatory to cutting them down. If good cuttings can be obtained now they should be inserted singly in thumb-pots, and be placed on a shelf in the green-

house; they will soon form roots, and grow into good flowering plants for next year. What is termed the "decorative," and also the fancy section, require much the same treatment. The zonal Pelargonium we find most useful to begin flowering when the other sections are over, and for this purpose we have plants potted into 6-inch and 7-inch pots; these will continue to produce flowers until October, when a fresh batch of plants, which are also now in preparation, will take their place; this last lot are from cuttings taken off in April. They are yet in large 60-sized pots, but will be potted off as soon as all the bedding plants are cleared out of the way. *J. Douglas.*

THE HERBACEOUS CALCALARIAS.—Of late several notices of collections of these have appeared in the columns of the *Gardeners' Chronicle*. That fine strains of Calceolarias are being grown is a fact no one will deny, but one is sometimes disposed to ask, in the work of improvement does the habit of the Calceolaria receive as much attention as the flowers? Thirty years ago, when there was as much activity among the raisers of Calceolarias as there is in the present day, and when it was customary to name new varieties and propagate them by means of cuttings, it was strongly insisted upon that habit should have as much attention as flowers. The time soon came when the practice of naming flowers was discontinued, and seedlings were depended on entirely, and then it was that the production of flowers received more attention than habit, and a deterioration of the latter characterised more or less the finest strains. It was owing to this that Mr. James and others attempted to work something of the sturdy habit of the shrubby varieties on to the large-flowering type, and we had to some extent size of flower in combination with habit, and thus an important stage was reached. Since then signs of deterioration have manifested themselves again. We have now flowers of great size; but what shall be said of their form? All the fine properties of form and outline that were so strenuously contended for by the last generation of florists appear in danger of being altogether forgotten, and we have now, generally, a heritage of large, flat, angular, illshaped flowers that have nothing but their size and showy colours to commend them to public notice. There are exceptions to this, but they are few. At the great Whitson show at Manchester several collections of Calceolarias were staged; but, with the exception of the 1st prize lot, the quality of the flowers was scarcely in advance of those shown twenty years ago.

We raise a new department. If the material on which raisers are now working does not yield satisfactory results, let them hark back to first principles of form and habit and start afresh. It is often advantageous to do this with flowers, and the act carries with it no necessary sense of failure. In the great heart of Nature there lies an infinity of form, colour, and the other characteristics of a fit beauty, waiting till the touch of the patient worker shall call them forth and transmute them into the precious metal of realised facts. There can be no real pause in the development of any flower. The possibilities in Nature are as infinite as the starry heavens above, and they stretch away into a space so vast that generations very remote will not have cause to fold their hands and say, "We have discovered all." There are deteriorating as well as improving influences at work, giving tone and direction to the efforts of the raiser, and it is necessary he should, as far as in him lies, seek to reduce the first to a minimum, and impart added decision of attainment to the second. Floriculture, pure and simple, needs something like a revival in our midst; and it may be that new men are coming forward to tread the old paths by which so much of floral renown was won in the past. *R. D.*

CALCEOLARIAS AT READING.—Only a few weeks ago a fine and interesting trial of these were on view at the London Road Florists' Seed-grounds of Messrs. Sutton & Sons at Reading. A large number of plants grown in the fine style peculiar to this firm fitted a lean-to house of considerable dimensions. Among the plants were many that comprised, in a happy union, size and form of the flowers with brilliant colours, and a short-jointed, robust habit of growth. It is only just to Messrs. Sutton & Sons to say that, having noticed the faults of form and sparseness of habit that characterised some of the prize strains of Calceolarias, they have resolutely set themselves to work to improve both, and they have succeeded in a remarkable degree. The most patient and persistent crosses have been attempted, and not

only have the shape of the flowers and the habits of the plants undergone substantial improvement, but new and striking shades of coloured flowers, especially in what may be termed "barred" flowers, are noticeable. Such a strain produces rare exhibition plants, as would be reasonably inferred from the character of the specimens grown by Messrs. Sutton & Sons.

Reports of Societies.

Royal Horticultural. *June 13.*—The falling-off alluded to in a recent number was again apparent on Tuesday, and the committee meetings, as well as the evening *file*, were, as a consequence, of a less interesting character than they should have been. For the latter event, always looked forward to with a great amount of pleasure, the weather was unfortunately as unfavourable as it well could be, a drizzling rain commencing about 6 P.M., and continuing throughout the night with but slight intermissions. Outside promenading—always the most enjoyable feature of an evening *file*—was of course out of the question, and the result was, to some extent, a crush in the conservatory and arcades, which were well illuminated with the electric light, except perhaps the conservatory, which was not a success, the lights being very unsteady. The arcades were nicely decorated by Mr. Barron with large collections of Pelargoniums, Gloxinias, Begonias, Fuchsias, Mignonette, and a large assortment of other well grown plants from Chiswick, aided by capital collections from B. S. Williams, Messrs. Veitch & Sons, and Messrs. Rivers & Son, whose pot Nectarine and Cherry trees, well laden with fruits, were very much admired. Cut flowers of a bold and effective character were contributed by Messrs. Barr & Sugden and Messrs. Hooper & Co.; and Mr. C. Noble contributed some grand bushes of his very fine Rhododendron, which has been christened in his own honour. In the eastern arcade there were several table decorations, but none which call for comment on the score of novelty or unusual excellence.

SCIENTIFIC COMMITTEE.—Rev. M. J. Berkeley in the chair.

Hollyhock Fungus.—Rev. M. J. Berkeley showed *Hollyhock Fungus* unusually severely affected with the Puccinia Malvacearum. A species of Fusisporium was also present. Mr. Berkeley considered it possible that the spores were introduced with the seed.

Red-stained Timber.—The Rev. M. J. Berkeley showed pieces of timber taken from mid-walls of old cottages in Northamptonshire—the timber rotted and stained with a Sphaeria, *S. rhododaphna*.

Hybrid Dipladenia.—Mr. Wattie, gr. to T. Cordes, Esq., Bryn Glas, Monmouthshire, sent flowers of a very lovely pale pink Dipladenia, concerning which the committee were anxious to obtain further information.

Diseased Cabbage-leaf.—Dr. Masters showed a leaf of a Cabbage, the under-surface of which showed numerous pustules. The first appearance presented was that of a small shining pimple springing from the nerves of the leaf, and very frequently from the knots where the smaller secondary nerves interlace. Ultimately the pimple becomes an open, longitudinal pustule, averaging about one-tenth of an inch in length, with a central slit, and everted, dry, somewhat corky edges. Microscopic examination showed the cellular tissue generally much enlarged, with a deficiency both of chlorophyll and of starch. The wood-cells and vessels were also enlarged, and deficient in thickening matter. It was supposed that the injury was due to a mite.

Tumours on the Branches of Abies amabilis, &c.—Dr. Masters showed specimens of shoots presenting irregular smooth oodose swellings, such as cause such unsightly deformities in the case of *Abies nobilis*. The swellings in question are caused by an insect allied to that which causes the American blight on Apple trees. The alterations of structure are similar to those described by Trilieux in the case of the Apple, and briefly consist in the enlargement of the cells of the inner bark and of the outer layers of wood, the constituent cells of both being enlarged, altered in form, and comparatively destitute of the thickening substance in the interior. The ordinary flattened or oblong brick-like cells of the herbaceous bark containing chlorophyll are also much enlarged, and their flattened form replaced by a globular one. The wood cells were not only enlarged but dis-aggregated, causing the spongy appearance noticed when the tumours are cut into. Purplish discolorations of the wood are also seen. On the whole, the changes consisted in the modification of the ordi-

nary tissues, not in the formation of any new ones. It was generally thought that there was no remedy for this deformity—at any rate, it was but rarely any attempt was made to combat it; but Mr. Barron, of the Elvaston Nurseries, Borrowash, has succeeded in killing the insect by means of Fir-tree oil, and healthy growth subsequently ensued.

Thuya Lobbi and *T. gigantea*.—Hon. and Rev. J. T. Boscaewen showed figured specimens of these, to show that the two were different. The specimen called Lobbi had been recognised by Lobb himself as the true Lobbi. The specimens were referred to Dr. Masters for examination and report.

Iris Fungus.—From Mr. Lynch, the Botanic Garden, Cambridge, came specimens of Iris leaves affected with the *Iris Puccinia*, together with notes thereon by Mr. Berkeley and Mr. Lynch. The specimens were referred to Mr. W. G. Smith for further examination and report.

Plants, &c., Exhibited.—Dr. Masters showed from Mr. Barron's nursery at Borrowash cones of *Pinus contorta*, a Californian species, remarkable for its curiously twisted branches and deep green leaves. The cones were between 2–3 inches long, ovoid-conical, the umbo of the scales prolonged into a long awl-shaped point. Dr. Masters also showed a branch with cones of *Ficea ajacis* (probably the variety described as *microserpa* of Lindley, and the var. *japonica* of Maximowicz). The plant is fully described in the *Gardeners' Chronicle*, January 24, 1880, p. 115. It is often confounded with *P. Alcockiana*, which, however, has more needle-like, less flat leaves than in *P. ajacis*, in which also the apex is abruptly acute, not gradually so, as in *P. Alcockiana*. The difference between the two is clearly observable in the young growing lateral shoots of the year, which in *ajacis* are flattish on one surface, convex on the other, while in *P. Alcockiana* they are more perfectly cylindrical.

From the same nursery Dr. Masters brought specimens of a Pine under the name of *P. tabuliformis*, which he considered might be the true *P. Massoniana* of Lambert; also of *Larix leptolepis*, a Japanese Larch.

Acacia salicifolia was shown from the same nursery. This shoots are greenish striped with silver, the shoots of the year and the petioles pale claret-red. The glabrous leaves are palmately 3-lobed, lobe deltoid, acuminate, doubly dentate. The samaras are in long pendulous racemes, the pedicels slender, appressed, about $\frac{1}{4}$ inch long, young samaras measuring $\frac{1}{2}$ inch across, wings divergent, obliquely oblong. From Mr. Kinghorn's nursery at Richmond came specimens of the bark of *Pinus Bungeana*, the white-barked Pine of China, in which the bark flakes off as in the Birch and Plane, leaving the uncovered bark of a pale whitish hue. From Herr Kirchoff, of the Royal Gardens, Donaueschingen, came a fine plant of *Tilandsia Furstenbergii*, an acaulescent species with tufted glaucous leaves, dilated at the base, linear-lanceolate, channelled on the upper surface, and finely toothed at the margins. The flower-spike is erect, thickly beset with beautiful lanceolate rosy bracts, powdered over with whitish meal.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. Messrs. Veitch & Sons were the largest exhibitors of new plants at this meeting, their contributions including *Aerides formosum*, hort., a partly supposed hybrid between *A. larpentae* and *A. odoratum*; *Nepenthes Mastersiana*, which was figured and described at p. 749, vol. xvi.—a very vigorous growing seedling from *N. sanguinea*, itself not one of the easiest to cultivate; *Adiantum Legrandii*, a garden variety of the *A. gracillimum* type, but having imbricated segments; *Rhododendron balsamiflorum*, quite a novelty, the flowers being very double and salmon-pink in colour; *Sarracenia porphyoneura*, with erect pitchers with large circular lids, which, as well as the upper part of the pitcher itself, is traversed by purple-coloured veins; *Impatiens Sultanii*, a dwarf species, from *Zanzibar*, with lanceolate, deep green, shining leaves, and rose-crimson flowers of moderate size; *Gloxinia Robin Hood*, intense blood-red, with the margins of the segments of a paler shade; and *Gloxinia Garibaldi*, a fine pure scarlet. Herr Kirchoff, Royal Gardens, Donaueschingen, Baden, sent a flowering plant of *Tilandsia Furstenbergii*, noticed under the head of the Scientific Committee. From Sir Trevor Lawrence's garden Mr. Spyers brought up a magnificent variety of the grand *Cattleya piggas*, named *Purfordensis*, and which is entirely new in all its parts, the petals the type, and most richly coloured; *Zygotium* expansion, a species remarkable for its tall spike of flowers, and its broad purplish-lilac lip; and under the name of *Masdevallia Harrayana striata*, the fine variety described as *M. Harrayana versicolor* in our number for September 3, 1881, p. 306, as having made its appearance with Mr. Stevens at Trentham in an imported batch. A well grown specimen of *Cattleya Warneri*, with fifteen flowers, was sent from Mr. & Mrs. Salter, gr. to J. Southgate, Esq., Streatham; and a small plant of *Masdevallia tovarensis* with fourteen flowers, which had been grown in a cool-house, came from the Chairman's collection. A very pretty form of *Odontoglossum vexillarium* named

Cobbanium, in which the labellum is pure white, and the upper sepal and two upper petals shaded with rose-lilac; and a strongly grown piece of Epidendrum vitellinum majus came from W. Cobb, Esq., Sylvendale Lodge, Sydenham. From Messrs. Vervaeck & Co., Ghent, came flowering plants of *Bollea caelestis*, and *Odontoglossum nebulosum*; and Messrs. John Laing & Co. sent a very large scarlet-flowered tuberous Begonia, named after the Hon. and Rev. J. T. Boscawen. From Chiswick came, amongst other things, one of M. Lemoine's seedling Ivy-leaved Pelargoniums, *Comtesse Horace de Choiseul*, a very fine double pink. Mr. W. Hugh Gower, Tooting, showed a new curled leaf Golden Feather; and Messrs. J. & J. Hayes, of Edmonton, a new decorative Pelargonium, named Gold Mine, a pretty variety, with flowers of clear scarlet, with a dark blotch and light centre. *Viola Champion*, a fine free-flowering white variety, came from Messrs. Heath & Son, Cheltenham; and a free-flowering dwarf perpetual Carnation, named Charles Page, and having fine reddish-crimson blooms, came from Mr. Duffield, of H. K. Mayer, Esq., Winchmore Hill. Mr. Gray, of Eggsgrove, showed a pale variegated Birch; and an Mr. T. S. Ware, of Tottenham, came a choice assortment of hardy plants, including a fine variety of *Lilium elegans*, called robustum; strongly flowered spikes of *Orchis foliosa* and some of its varieties, the pretty little *Bomarea oculata*, *Tropaeolum polyphyllum*, &c. From Swanley Mr. Cannell brought up an excellent display of cut blooms of double-flowered Petunias, &c.

First-class Certificates.

- To Messrs. James Veitch & Sons, for *Adiantum Legendarii*.
- To Messrs. James Veitch & Sons, for *Acerides formosum*, hort.
- To Messrs. James Veitch & Sons, for *Nepenthes Miersiana*.
- To Messrs. James Veitch & Sons, for *Rhododendron balsamiflorum*.
- To Messrs. James Veitch & Sons, for *Gloxinia Garibaldii*.
- To Messrs. James Veitch & Sons, for *Gloxinia Robin Hood*.
- To Sir Trevor Lawrence, Bart., M.P., for *Cattleya gigas Burfordiensis*.
- To Sir Trevor Lawrence, Bart., M.P., for *Zygopetalum eximium*.
- To M. Lemoine, for Ivy-leaved Pelargonium *Comtesse Horace de Choiseul*.
- To Mr. T. S. Ware, for *Lilium elegans robustum*.
- To Messrs. J. & J. Hayes, for Pelargonium (decorative) Gold Mine.
- To Messrs. John Laing & Co., for Begonia Hon. and Rev. J. T. Boscawen.
- To W. Cobb, Esq., for *Odontoglossum vexillarium* var. *Cobbanium*.
- To Mr. Duffield, for Carnation (perpetual) Charles Page.
- To Messrs. Heath & Son, for *Viola Champion*.
- To Messrs. Wood & Ingram, for *Lobelia punila* Ingrami.

FRUIT COMMITTEE.—John Lee, Esq., in the chair.—Mr. Farr, got to Mrs. K. Sturges, Gibbons Grove, submitted to the judgment of this body very fine samples of Sir J. Paxton Strawberries and Brown Turkey Figs; and Messrs. Sutton & Sons sent heads of their Late Queen Broccoli, a very good late variety, but out of condition as shown here. From Messrs. Carter & Co. came examples of the true Fern-leaved Parsley, and a well-cured variety named New Perpetual, of which it is reported that it stands for three or four years before it runs to seed.

Edinburgh Botanical: June 5.—The Society met in the Royal Botanic Garden class-room, Dr. Cleghorn, Vice-President, in the chair.

The following communications were read:—
 I. "Notice of the Death of Joseph Decaisne," Member of the Institute, Honorary Fellow. By Andrew Taylor, Assistant Secretary.
 II. Report of the meeting of the Scottish Alpine Botanical Club at Dalwhinnie and neighbourhood at the close of July and beginning of August, 1881. By William B. Boyd, Esq., of Faldenside. The Club were fortunate enough to rediscover the rare *Menziesia cœrulea* on the Sow of Athole. The plant was first found here by Emeritus Professor Balfour, but few subsequent observers have done so. *Empetrum nigrum* and *Azalea procumbens* both grow plentifully on the mountain sides, and are to an unpractised eye exceedingly like it; but a few accidental late flowers of *M. cœrulea* were at last come on. Along the side of Loch Erioch were got *Utricularia intermedia* in flower, also nice tufted varieties of *Blechnum boreale*, and *Pinguicula vulgaris* in flower on the ascent to Ben Lawers. The Club collected, amongst other things, a nice variety of *Aspidum lonchitis*, with perfectly smooth pinnæ; and at the summit *Saxifraga cœrulea*.
 III. Mr. Taylor exhibited recent additions to the University herbarium. These included fungi sent by Joseph Bancroft, M.D., from Australia; also dried plants from Eilatrye, Central Africa, sent by John Buchanan, Esq.; likewise dried plants from Karam Valley, &c., Afghanistan, collected by Surgeon-Major Aitchison in 1880. Living plants grown from seeds and bulbs from the above African localities were also exhibited.

These included *Streptocarpus caulescens*, and several Leguminosæ.

IV. Professor Dickson exhibited a specimen of *Polemonium coriandrum* from the garden of G. H. Potts, Esq., Fettes Mount, Lasswade. It had a broadly fasciated stem, with thickly clustered flowers along its edge-like extremity. This form seems to be permanent, as it has now come up for the second season at Mr. Potts'.

V. Professor Dickson also showed two exhibits sent by Mr. Brown—one a specimen of *Cheiranthus Cheiri* var. *gynanthus*; the other a profliferous Rose, where the second flower, instead of springing from the organic extremity of the floral axis, i.e., the bottom of the hollowed out receptacle, springs from its margin in the neighbourhood of the insertion of the corolla and stamens.

VI. Mr. Sadler exhibited a lithograph of a peculiarly branching Silver Fir grown at Conshead Priory, Cumberland, giving at the same time measurements of girth, &c.

VII. The following plants in flower were exhibited from the garden:—

- | | |
|------------------------------------|-----------------------------|
| <i>Aciphylia squarrosa</i> | <i>Gentiana ornata</i> |
| <i>Delphinium nudicaule</i> | <i>Silene quadridentata</i> |
| <i>Allium oreophilum</i> | <i>Lewisia rediviva</i> |
| <i>Orchis maculata</i> Burch. | <i>Artemisia repens</i> |
| " <i>maculata alba</i> | <i>Veronica Lyallii</i> |
| <i>Dianthus alpinus</i> | <i>Polemonium humile</i> |
| <i>Androsace ciliolata</i> | <i>Polygonum capitatum</i> |
| <i>Androsace rotundifolia</i> var. | <i>Goodyera repens</i> |
| " <i>macrocalyx</i> | <i>Saxifraga propaginea</i> |
| <i>Primula horridula</i> | " <i>mutata</i> |
| <i>Erius</i> | " <i>Guthrieana</i> var. |
| <i>Erdraianthus caribæus</i> | |

Nottinghamshire Horticultural and Botanical.—The monthly meeting of the above Society was held on Monday evening last. There was a large attendance of members and their friends, and Mr. James Booth, of Fern House, Mapperley Road, occupied the chair. Mr. C. P. Pearson, of Chilwell, read a long and interesting paper on the "Pelargonium and its Culture," dealing with the plant from the first hybridisation of the common wild variety by the celebrated Donald Beaton down to the present beautiful varieties now in commerce. The reader illustrated his paper by exhibiting the different forms or stages of hybridisation by living specimens. A discussion followed, and a vote of thanks was awarded the essayist. There was a large show of cut flowers and fruit, especially noticeable being a very fine collection of named *Vitifructus* from Mr. Pendry, of Car Colston, and a very fine netted Melon from Mr. Swanwick, of Sherwood Lodge. Mr. German, of Malvern House, brought some fine blooms of *Cattleya atrina*, *Cypripedium Parishii*, and *Andrium Andreamum*, all of which were very much admired. The different exhibitors and the Chairman were accorded a hearty vote of thanks.

Foreign Correspondence.

A TRIP TO MALACCA: *Tapioca Cultivation*.—As *Tapioca* is now one of the principal articles of export from the Straits Settlements a few notes made during a flying visit I recently paid to Malacca regarding the mode of cultivation and the primitive and modern modes of manufacture there employed may not be uninteresting to some of your readers. During a six years' residence in the Straits I was never fortunate enough to have sufficient time to spare in Malacca to go far beyond the limits of the town, yet when one reflects on what Griffith, Thomas Lobb, Maingay, and others have unearthed from its jungles it has become to the botanist and naturalist the most interesting part of the Straits Settlements, and while driving along its country roads or traversing its jungle paths and reflecting on the work done by those lovers of Nature, one feels that he is on classic ground so far as botany is concerned.

It was, therefore, with no little satisfaction that I accepted an invitation from Mr. J. M. Lyon, who is the head of an engineering firm in Singapore that has acquired considerable local renown for its inventions for manufacturing Tapioca, to accompany him on a short trip to Malacca before leaving for "the land of the white elephant."

Leaving Singapore at 4 P.M. on September 14 by the steamship *Mayflower*—which, by-the-by, is not the same craft which conveyed the "Pilgrim Fathers" from the shores of Old England "converted"—we arrived in Malacca (locally known as "Sleepy Hollow") at 9 A.M. next morning, and at once called on some of the principal Tapioca planters.

Before starting for the plantations we were treated to a surfeit of Malacca fruits, which at the time of our visit were abundant, including delicious *Dukus* (*Lansium domesticum*), the *Tampui* (*Hedycaurus malayanus*), which, I think, is much to be preferred to the *Mangosteens*, of which, of course, we saw plenty, and splendid *Chikos* (*Sapota Achras*), which, although it is not an indigenous fruit, thrives and fruits to perfection in Malacca.

Before noon, however, in company with two of the

most extensive and energetic planters in the colony, Mr. Chea Hoon Bong and Mr. Koh Hoon Boh, we were en route to their plantations.

To the estate of the former gentleman, which is about 10 miles from Malacca, the drive was very enjoyable, the sides of the road for some distance being mostly overshadowed with Cocoa-nuts, while underneath the *Rambes* trees (*Picardaria dulcis*) were loaded with long hanging racemes of fruit, while large clumps of *Salak* (*Zalacca edulis*), *Licalas*, *Bauhinias*, *Poinciana pulcherrima*, *Ixoras*, &c., served to diversify the vegetation. Some fine native-grown Coffee was passed, laden with ripe fruit, and further on a thriving Nutmeg plantation was passed through. Further on, where the jungle road begins, there was little to interest—*Rhodomyrtus*, *Grewias*, *Mussaenda*, and *Melastoma* forming the larger part of the vegetation.

The mode of cultivating *Tapioca* in the Straits varies but little on different estates, whether owned by Europeans or Chinese. If jungle composed of large trees is to be cleared the trees are cut down at some height from the ground, the stumps remaining in the ground and the whole set on fire, the charred remains of the trees being generally allowed to lie where they fall until the first crop is being cleared off, when they are utilised for fuel. After the ground has been dug over and the soil put into a friable condition the cuttings of *Tapioca* are planted in rows from 3 to 4 feet apart and about 9 inches or a foot in the rows. The cuttings are lengths about a foot long of the stem of the matured plant. These root easily, and in less than two months the ground is covered with a carpet of green almost a foot high. From this time to the time the crop is lifted, beyond weeding and slightly banking-up, nothing is done to the crop, although on some estates the tall stems are sometimes cut down to about 4 feet from the ground, which must evidently keep the plants in a growing state, and prevent the proper storage of starch. On some estates I have known the crop lifted nine months after planting, with good results; but the Chinese planters in Malacca usually keep the roots in the ground sixteen or even eighteen months. Perhaps each has its advantages, but it has struck me that tubers kept in the ground over a year develop a large amount of woody fibre without increasing the quantity of starch, which is evidently a disadvantage to the machinery. The general mode of lifting the crop is to cut off a certain portion of the tops, and pull up the tubers, the broken pieces being dug out afterwards. Of course, on land that has previously carried a *Tapioca* crop, manure should be used, which by some planters is applied previous to planting, and by others after the young plants have started into growth. In Malacca, however, cow-shed refuse is a scarce article, and the cost of carriage would be considerable where estates are distant from the base of supply and roads in many instances steep and bad.

On one estate in Singapore under European management a green crop is grown with the *Tapioca*, consisting principally of *Arachis hypogæa*, various *Crotalaria*s, principally *C. striata*, &c., which is dug in with lime, &c., while green, for the next crop, but the plan does not appear to find acceptance with other planters. The root of the *Tapioca* it is hardly necessary to describe here, but I may state that while in Malacca I saw some specimens over 2 feet long, and weighing between 6 and 7 lb. The roots being laid in heaps are carted to the manufactory, and the sticks laid in stacks for supplying cuttings for the next crop.

The estate first visited in Malacca was Bukit Bruang (literally Bear Hill), and here we found J. M. Lyon & Co.'s patent machinery in full working order.

Of course steam is the motive power, in fact the most primitive styles of preparation seem unable to do without this, as I will show later on. The roots being first divested of their woody tops, are thrown into a large revolving drum, in which pipes are so arranged that constant jets of water play on them as they are turned over and over, and gradually they reach the farther end of the drum perfectly clean, and empty themselves into a rasping machine, where they emerge in the form of a fine pulp, which is thrown direct from the rasper into another cylinder covered either with stout muslin or brass-wire gauze, through the sides of which jets of water are continually passing. By this process the starch is separated from the pulp, the starch passing through the muslin or gauze

into a tank beneath, where further supplies of water send it off through gutters to vats prepared for its reception, while the pulp is discharged from the drum into baskets and thrown into heaps either for cattle feeding or manure, for either of which I imagine it is little suited.

After the starch in the vats has been allowed to subside the water is gradually drawn off, fresh water supplied, the whole stirred up and again allowed to subside, and the water again drawn off. The treatment of the starch in this stage depends on the purity of the water used—as, unless the Tapioca when prepared is of the purest whiteness it can hardly be given away. Hence, one of the principal points to be attended to is the supply of clean water in abundance. After the starch has become sufficiently pure it is allowed to dry in the vats, whence it is cut out in cakes and is then ready for the last stages of preparation. If Tapioca flour is required it is placed first on racks to dry, then on large, almost flat tin sheets which form the top of a brick flue where an extremely gentle fire is kept up.

If flake Tapioca is requisite it is submitted to rather stronger heat in concave pans at first, whence it is removed to the previously mentioned sheets and kept turned over with wooden rakes, &c., until it assumes the flake-like form so familiar to consumers in Europe. The flakes are then sifted, to separate the various sizes, and the prepared Tapioca is ready for piling in the bags for shipment.

After a liberal tiffin, for which we were indebted to the proprietor of the estate, Mr. Chea Hoon Bong, we started for an estate some 8 miles farther on belonging to Mr. Koh Hoon Boh (the name of which I have unfortunately forgotten), and as I have mislaid all my notes about our first day's trip I am obliged to fall back on memory for particulars.

Now commenced the real business of the day. The road from Bukit Bruang to this estate is in some places so steep and had that only light traps are available, hence it became necessary for either my companion or myself to drive while our Chinese hosts came on behind in another carriage. As it soon became apparent that unless I drove we should remain behind at Bukit Bruang, I was compelled reluctantly to take the ribbons, more especially as I found that our united weight amounted to close on 32 stone, to say nothing of the syce, who would be compelled to hang on behind somehow. The road did not belie our expectations, as it lies mostly through Tapioca estates, and cut up by constant bullock-cart traffic, with the end of charred trees projecting on one side, and living ones with enormous buttresses jutting out on the other, combined with stiff inclines and declines and sharp corners, so that it was out of the question altogether to think of looking at the vegetation as we passed.

Arrived at our destination, we found the machinery in splendid order, in three hours putting through 120 piculs (a picul is 133 lb.) of roots, one-fifth of which would be Tapioca eventually. On this estate about 20,000 acres are under cultivation. Reaching Bukit Bruang on the return journey safely, we changed vehicles, and arrived at Malacca at 8 P.M., visiting a very flourishing Nutmeg plantation belonging to Mr. Koh Hoon Boh on the way, and leaving our hospitable friends at their estates.

Arrived in Malacca, we found ourselves pretty well tired, but our labours were by no means yet at an end. My companion had declined several country invitations to dinner and a bed for each of us, as he had always been accustomed to put up at the house of a planting friend in Malacca, and depended on being able to do the same this time; consequently, on arriving at the entrance, we got our traps out and discharged the carriage. Judge of our surprise when, after sitting down a little while, we were told that Mr. — was away at the plantation.

Calling a carriage, we started to find somewhere to put up at, as Malacca possesses no boarding-house or hotel, and as there is nothing to do in Malacca after 6 P.M. residents retire early, so on driving to one house after another we found them shut up for the night. Driving to the residences of some bachelor friends we were informed by the servants that "Master had gone for a walk, and the time of his return was uncertain." This caused us to look rather stupidly at each other, and after a drive all around the town I proposed that we should put up in the carriage for the night, my companion proposing that we should go back and take possession of the house of one of our absent friends. This we acted on, and suc-

ceeded admirably, being warmly welcomed by our host after the first surprise of finding "men in possession."

I have related this incident rather in detail as it will help to give some idea of the state of civilization at which Malacca has arrived, and as a "word in season" to travellers who think of visiting Malacca to make sure of a bed before arranging to stay elsewhere a night there.

Next morning at 6 o'clock we were en route to another estate, belonging to Mr. Koh Hoon Boh, at Matchap, about 18 miles distant. The first ten miles is along the public road, along some parts of which in wet situations are large indigenous plantations of the Giam (Malacca leucodendron), the bark of which is used by Malays for caulking their boats. In all directions we saw the natives busy planting the Rice fields.

On leaving the public road, however, our troubles began; to drive over the road we did the day before was a delight compared with the one it now fell to our lot to drive over, and it was with no little satisfaction that I gave up the reins at Matchap to the syce, after his informing me when within 50 yards of the house that I had 2 miles more to drive. Here we found the primitive style at work. The roots are first half-peeled with knives, in which operation a large part of the root is cut off, then thrown into a tank of water when they are washed by the Chinese treading on them; thence they are lifted in baskets to the rasping machine, and worked by a traction engine, built in the brickwork, and is regulated by hand. The pulp falls from the rasper into baskets, which are carried about 20 yards, and the contents emptied on muslin covers of concave wickerwork baskets, above which a wooden water-gutter is placed, the supply of water being regulated by plugs over the baskets. Here the Chinamen separate the starch by arranging a constant fall of water on the muslin, and keeping the mass well stirred with their hands until they think they have extracted all the starch, when they throw the refuse pulp away, and receive a fresh supply from the rasper, the water with which they wash the pulp serving to convey the starch to vats prepared for it. Of course the starch prepared in this manner requires more washing than that prepared by the machinery I have described, and I venture to think that consumers in England would prefer Tapioca made by machinery, when it need never be handled, to that which is carried about so much amongst decaying vegetable matter and mud, as that hand-prepared usually is. Here the starch is baked by fire passing beneath a tile-covered flue on which it is placed. Pearl Tapioca is manufactured here as follows:—A cloth is attached like a hammock to the beams and kept open by cross sticks. A man at each end alternately jerks the cloth to and fro, the slightly warmed starch under this treatment soon forming small, completely spherical balls, which are afterwards baked on a tile-covered flue.

The number of coolies about here was surprising, and it is hardly necessary to say that only about 30 piculs of Tapioca is produced per diem; in fact, Mr. Koh Hoon Boh is so thoroughly convinced of the superiority of manufacture combined with economy of the preparation by machinery, after comparing the cost at his estate, which we visited the day before, with the cost of hand preparation, as at Matchap, that he ordered a machine to be erected at once.

After tiffin we returned to Malacca, where we were lodged and fed, in first-rate style, our host being Mr. Chea Hoon Bong, whose name is well known throughout the Straits (and beyond) as one of the most liberal-minded and hospitable Chinese gentlemen in the colony. The next day we parted from our hospitable friends of Singapore per steamer *Dillon*, arriving on Sunday morning loaded with presents of fruit for ourselves and Singapore friends. Thus ended what is probably the last of my trips in the Malay peninsula, and certainly, thanks to my companion and our Chinese hosts, the most enjoyable one.

After tiffin we returned to Malacca, where we were lodged and fed, in first-rate style, our host being Mr. Chea Hoon Bong, whose name is well known throughout the Straits (and beyond) as one of the most liberal-minded and hospitable Chinese gentlemen in the colony. The next day we parted from our hospitable friends of Singapore per steamer *Dillon*, arriving on Sunday morning loaded with presents of fruit for ourselves and Singapore friends. Thus ended what is probably the last of my trips in the Malay peninsula, and certainly, thanks to my companion and our Chinese hosts, the most enjoyable one.

Can you or any of your readers give me any information as to the probable date of the introduction of Tapioca into the Straits, or by what nation it was first brought to the East? I have not Crauford's *Descriptive Dictionary of the Indian Islands* to refer to, but so far as I recollect he does not mention Manihot utilisissima, *Traveller*,

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON
FOR THE WEEK ENDING WEDNESDAY, JUNE 14, 1882.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRI- CAL.—Degrees from Glass, in Fathoms 5, 10, 15, 20, 30, 40, 50, 60.	WIND.	RAINFALL.
	Actual reading.	Height to which reduced.	At 9 A.M.	Average of Day.	At 3 P.M.	At 9 P.M.			
June 10	29.57	—0.01	54	59	52.0	51.8	—	2.9	0.40
11	29.33	—0.40	50	49	51.5	51.1	—	6.8	0.35
12	29.53	—0.40	58	56	57.0	56.8	—	5.0	0.67

June 8—A dull, overcast day and night. Steady rain all the evening.
9—A dull day; gleams of sunshine at times. Thunder and lightning, with hail and rain, from 12.25 A.M. till 6 P.M. A dull, overcast, rainy night.
10—A very dull, with a dry, slight rain in morning. Cloudy night, thin rain.
11—Fine morning; dull day; occasional rain. Dull, cloudy night.
12—Rain in early morning; dull, rainy day. Alternately clear and cloudy. Showers of rain and hail. A cold, strong wind at night.
13—A dull day with a slight rain in afternoon. Rainy all the evening.
14—Rain in early morning. A fine bright morning; sun shining. A dull afternoon; overcast. Fine, clear night.

LONDON: Atmospheric Pressure.—During the week ending June 10, the reading of the barometer at the level of the sea decreased from 29.76 inches at the beginning of the week to 29.70 inches by 3 P.M. on the 4th, increased to 29.85 inches by midnight of the 5th, decreased to 29.71 inches by 9 A.M. on the 6th, increased to 29.77 inches by 3 P.M., and decreased to 29.73 inches by midnight of the same day, increased to 29.89 inches by 9 A.M. on the 8th, decreased to 29.46 inches by 9 A.M. on the 9th, and was 29.80 inches at the end of the week.

The mean reading for the week at the level of the sea was 29.72 inches, being 0.45 inch lower than last week, and 0.26 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 70°, on the 4th. On the 10th the highest temperature was 58°. The mean of the seven high day temperatures was 63°.

The lowest temperature in the shade in the week was 49° on the 5th; on the 6th the lowest temperature was 55°. The mean of the seven lowest temperatures was 51°.

The greatest range of temperature in one day was 18°.8, on the 4th; the smallest was 7°, on the 10th. The mean of the seven daily ranges was 12°.

The mean temperatures—On the 4th, 57°.8; on the 5th, 56°.7; on the 6th, 57°.7; on the 7th, 58°.2; on the 8th, 54°.8; on the 9th, 51°.1; on the 10th, 52°.9; of these those of the 4th and 7th were above their averages by 0°.7 and 0°.6, all the rest were below their averages by 1°.3, 0°.6, 2°.0, 6°.8, and 5°.2 respectively.

The mean temperature of the air for the week was 55°.4, being 2°.5 lower than last week, and 2°.2 below the average of the week.

The highest reading of a thermometer with blackened bulb in water, placed in the full rays of the sun, was 135°, on the 4th; the highest on the 10th was 76°. The mean of the seven daily readings was 112°.8.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 40°.2, on the 10th. The mean of the seven readings was 45°.3.

Rain.—Rain fell on six days, to the amount of 1.36 inch, of which 0.40 inch fell on the 8th, thunder-storm on the 9th, with hail.

ENGLAND: Temperature.—During the week ending June 10 the highest temperatures were 77° at Sunderland, 75°.8 at Cambridge, and 74°.1 at Nottingham. The highest temperature at Bolton was 63°.5, and at Truro and Sheffield 64°. The general mean was 68°.

The lowest temperatures in the week were 43°.2 at Bolton, 44° at Wolverhampton, and 45° at Hull.

The lowest temperature at Brighton was 49.2, and at Bristol, Blackheath, and Leeds, was 49. The general mean was 46.9.

The greatest ranges of temperature in the week were 31 at Sunderland, 30.2 at Cambridge, and 28.6 at Nottingham. The least ranges were 16 at Bristol, and Sheffield, and 16.6 at Liverpool. The general mean was 21.2.

The mean of the seven high day temperatures was highest at Sunderland, 70.4, at Cambridge 68.3, and at Brighton and Nottingham 66.9; and was lowest at Bolton, 59.3, at Liverpool 60.6, and at Sheffield 61.4. The general mean was 63.5.

The mean of the seven lowest night temperatures was highest at Plymouth, 52.8, at Truro 52.3, and at Brighton 51.8; and was lowest at Bolton, 47.1, at Wolverhampton 47.2, and at Nottingham 43. The general mean was 50.

The mean daily range was greatest at Sunderland, 22.2, at Nottingham 18.9, and at Cambridge 18.5; and was least at Plymouth, 9.1, at Truro 9.7, and at Liverpool 10.4. The general mean was 13.5.

The mean temperature for the week was highest at Brighton, 57.6, at Sunderland 57.5, and at Cambridge 57.3; and was lowest at Bolton, 51.4, at Wolverhampton 52.7, and at Liverpool 53.6. The general mean was 55.3.

Rain.—The largest falls were 2.59 inches at Wolverhampton, 2.50 inches at Bolton, and 2.01 inches at Nottingham. The smallest falls were .28 inch at Brighton, .09 inch at Cambridge, and 1.28 inch at Liverpool and Bradford. The general mean fall was 1.59 inch. Rain fell on every day in the week at Bristol, Sheffield, Liverpool, Bolton, Bradford, Leeds, and Sunderland, and on five or six at other stations.

SCOTLAND: Temperature.—During the week ending June 10 the highest temperature was 69, at Glasgow; at Aberdeen the highest temperature was 65.5. The general mean was 66.6.

The lowest temperature in the week was 39.6, at Edinburgh; and the lowest temperature was 50.2.

The general mean for the week was 49.7. The mean temperature for the week was highest at Dundee, 56.7; and lowest at Edinburgh, 53.8. The general mean was 55.3.

Rain.—The largest fall was 1.95 inch, at Greenock; the smallest fall was 0.69 inch, at Edinburgh. The general mean fall was 1.18 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON. MUSTARD.—The following query, inserted in Notes and Queries (41st series, ix., p. 450, May 13, 1851), has never been answered, and never repeated in that journal.—"Preliminary for Making Mustard.—Did Queen Elizabeth issue a proclamation for 'the right of mixing mustard?' And, if so, what was the language of such proclamation? The above, if inserted in your columns, may perhaps meet the eye of some correspondent who can, and will, kindly enable me to 'make a note of it.'" P. P.

STRAWBERRY BOTHELL BANK PROLIFEROUS.—Can any one tell me the difference between the Bothwell Bank Frolic Strawberry and President? Those I received last year under the former are certainly identical with what I have for years known by the latter name. How different.

Answers to Correspondents.

AUSTRALIAN BLUE FESCUE GRASS: W. C. & Son. The only true Fescue valid in Australia are two common European species—F. dactyloides and F. ovina.

CUCUMBER: Cae. It is the well-known Cucumber disease, no remedy for which has yet been discovered, of turning out the soil and beginning again. Please send us a piece of the root.

EKRATA.—Page 770, for "distinctive" read "distinctious;" for "Mr. Brown's" group, read "Mr. Brown's."

FONGLOVE: F. Shrimpton. See note at p. 749, in reply to "H. J. R."

GRAPES: F. E. The Grapes are not diseased, but both bunches and leaves are badly scalded, the former, in fact, spoiled, as we should suppose through the insufficient amount of ventilation. Give them more air, and especially open the ventilators a little early in the day, to allow the vines to dry before the sun gains power.

GUM: Florist. Found some white shellac very fine, and mix it in a stone jar to the proper consistency with methylated spirit. It should be kept warm, and will be shaken-up for a day, after which it may be kept in any cool place.

NAMES OF PLANTS: Y. C. Caloglypho asperata; Lactia elegans, a good variety; P. C. Lycaste aromatica.—L. L. C. Pyrus (Sorbus) latifolia.—C. W. D. Geranium macrochirum, Solidago virgaurea, a monaster of Chrysanthemum segetum?, Ranunculus neriis bore cirrino, and Ligularia sp. 11; F. Ireland, 1, Arthrochlamydeum; 2, Hyoscyamus niger; 3, and patients, near Hookeriana, — F. Dry, 1, Valeriana

pyrenaica; 2, Heuchera cordifolia; 3, Listera ovata; 4, Fraxinus oxera.—S. C. An Orchid, Calanthe varifolia.—Constant Reader. Garden varieties of Rhododendrons, which we cannot pretend to name. Please repeat your question.—P. H. A. 1, Eranthis europaeus; 2, Staphylea pinnata; 3, Lonicera Ledebourii; 4, Thalictrum aquilegifolium; 5, a Saxifrage, which we do not recognise.—H. C. P. A withered scarp, utterly unrecognisable.—G. Well. Dendrobium Dufrenoyi.—D. 1, Tradescantia virginica; 2, Dictamnus Fraxinella, white variety; 3, Asphodelus fistulosus; 4, Culegion. Why send such miserable scraps? If we had the memory of Mezzofanti, and the readiness of the calculating boy, in addition to the botanical knowledge of Robert Brown, we could not name such bits.

TITLE: E. F. We cannot tell you. The question is one for the landlord, or his agent.

VARIETIES: BEECH: F. Clark. Well worth propagating, but is not so good, from the great amount of whiteness in the leaf, that it will partially revert to the green condition; indeed, so white is it that we do not think its life could be preserved unless some green leaves were formed.

WATER LILY: F. P. Yes.

WELSH POPPY: Cannon & Keil. Meconopsis cambricum.

* * * Correspondents are specially requested to address post-paid, and to communicate for publication to the Editor, and not to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspaper should be careful to mark the paragraphs which they wish to be used.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

Markets.

COYANT GARDEN, June 15. The late cold dull weather has somewhat affected supplies, prices remaining as last week. For the same reason trade has been quiet. James Webber, Wholesale Apple Market.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Abutilon, Anemone, Arum Lilies, etc.) and prices per dozen or bunch.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Aralia Schiedelii, Arbor vitæ, Begonia, etc.) and prices per dozen.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Peaches, Pine-apples, etc.) and prices per dozen or bushel.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Artichokes, Asparagus, Beans, etc.) and prices per bushel or bunch.

SEEDS.

LONDON: June 14.—There was a very poor attendance on the seed market to-day, and no change of either interest or importance can be recorded. The reports of recent lower to-morrow's extent water-killled both in the States and Canada are confirmed, and Mr. Fothergill promises to be cheap and abundant; 50 tons of new English have been sold at 19s. per hundredweight, fair average quality, delivery during July and August. Values for white Mustard and Rape seed remain unaltered. The best seed, however, continues exceedingly dull, with slightly lower rates for Hemp seed. There is still an active demand for Spring Tares, and Peas, are almost exhausted. A few orders drop in for Scarlet Runner Beans. Linseed is slow of sale, at 3s. 7d. per cwt. John Adams & Co., Seed Merchants, 27, Mark Lane, London, E. C.

CORN.

At Mark Lane on Monday English Wheat moved off slowly at about the previous Monday's rates, which were also quoted for foreign, but East India Wheats showed 1/2 per quarter decline. Flour was rather easier than on Monday's night, but Australian rather firmer than it has been in the interior. So appreciable change occurred in the value of Barley, Beans, or Peas, Malt, or ex ship, was rather easier. Large supplies of Oats met a dull sale, and common Russian were 3d. lower. On Wednesday the small quantity of English Wheat at Mark Lane was held for full value, and foreign was also steady held, but the trade was very quiet. Flour was unchanged in value; Barley, Beans, and Peas were steady; Oats firm but quiet, and Malt unaltered.—Average prices of corn for the week ending June 12.—Wheat, 42s. 6d.; Barley, 27s. 5d.; Oats, 24s. 6d. For the corresponding period last year.—Wheat, 44s. 6d.; Barley, 31s. 6d.; Oats, 23s. 2d.

CATTLE.

At the Metropolitan Market on Monday rates for beasts were depressed 2d. to 4d. per stone, the largest decline being on second quality. The Cattle market included a 40 gross-few beasts of prime quality, which reduced the extreme quotations of the morning's trade. For sheep the trade was slow, and rates easier than on Monday week. In some cases lambs sold without alteration. Three English calves and four of the same breed, the supplies consisting chiefly of secondary Scotch. Quotations.—Beasts, 4s. 4d. to 5s. 2d., and 5s. 4d. to 6s. 12d.; calves, 5s. to 6s. 4d.; sheep, 5s. 4d. to 5s. 6d., and 6s. 2d. to 6s. 6d.; American, 5s. 5d. to 6s. 6d.; lambs, 7s. 4d. to 8s.—Thursday's market was firmer. Lamb, calves and sheep met with more attention, and were the best of the lot. Lambs were quiet, and calves and pigs unaltered.

HAY.

At Whitechapel on Thursday the supply of hay and straw was moderate, and the trade dull. Hay was 2s. lower. Quotations.—Prime Clover, 16s. to 18s. 1d. inferior, 6s. to 9s. 1d. and straw, 30s. to 35s. per load.—Cumberland Market quotations.—Superior old meadow hay, 120s. to 130s.; inferior, 84s. to 100s.; new hay, 100s. to 102s.; superior Clover, 120s. to 135s.; inferior, 105s. to 112s.; new, 84s. to 108s.; and straw, 54s. to 60s. per load.

POTATOS.

The Borough and SPITALFIELDS Markets respectively state that a steady trade has been found for full supplies at the following quotations.—Old Champions, 30s. to 70s.; ditto Flukes, 100s. to 110s.; ditto Argentinum Bonitas, 100s. to 110s.; ditto Victoria, 100s. to 110s. per ton. New Jersey rounds, 9s.; ditto, kidneys, 11s. to 12s.; ditto, Cherbourg rounds, 8s. 6d.; ditto, kidneys, 10s. per cwt.—The imports into London last week consisted of 2347 tons from Jersey, 12,559 packages from Ostend, 1055 boxes from Barleux, 3150 packages, 2759 half-boxes from London, 5200 boxes 112s. cases from Cherbourg, 2500 hit-boxes from Cadix, 531 packages St. Nazaire, 334 cases Malta, and 8 cases from Naples.

Government Stock.—Consols closed on Monday at 100s. to 102d. for delivery, and 102s. to 104d. for the account. Tuesday's figures were, for delivery, 100s. to 102s., and 102s. to 104s. for the account. The closing prices of Wednesday were, for delivery, 100s. to 102s., and 102s. to 104s. for the account. On Thursday Consols, at 101s. higher, and 104s. higher for the account. The above quotations are all ex div.

Hocking's New Patent
AUTOMATIC COKE
AND GAS BOILERS.

Will maintain a uniform temperature for from 12 to 15 hours, and often from 15 to 20 hours, with one small charge of common Gas Coke of the cheapest kind. For economy and efficiency in combination with cleanliness and comfort these Boilers are, beyond the possibility of a doubt, the greatest boon ever offered for the purpose of Heating Conservatories, Halls, and other Buildings, where little attention is required.
Every particular with testimonials given on application to
FRANKLIN HOCKING
and CO. (Limited), 27, Hanover Street, Liverpool.

Automatic, Economic, and Efficient.

ROCHFORD'S IMPROVED HORIZONTAL BOILER

Unequalled for Simplicity, Power, and Economy.
See *Gardener's Chronicle*, Jan 1882, and Nov. 19, 1881.

As inferior imitations of this now well-known Boiler are being advertised and sold to the detriment of its reputation, C. F. K. & Co. beg to inform Gardeners and the Trade generally that Mr. Rochford has assigned to them the sole and exclusive right for its Sale and Manufacture.

HORTICULTURAL WIRE WORKS,
The Pheasantry, Beaufort Street, Chelsea, S.W.

Oil Paint No Longer Necessary.
HILL and SMITH'S BLACK VARNISH
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark.)

THIS VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by the ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, King Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Ploverfield Park, June 21, 1876.—SIR,—I have this day forwarded from Chestport to your address a black varnish cask, to be filled and returned, with as good Varnish as the last we had, which I candidly admit was the best we ever had. Yours faithfully, Wm. Gos."
CAUTION—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
H. S. S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.
Large Illustrated CATALOGUE of Fencing, Handles, Field and Entrance Gates, &c., sent free on application to
HILL and SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 120, Buchanan Street, Glasgow.

MANSION HOUSE, LONDON.

Grand Rose Show

WILL BE HELD AT THE MANSION HOUSE, ON FRIDAY, JUNE 30, 1882, IN AID OF THE FUNDS OF THE ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO BRIDGE ROAD, AND THE Convalescent Home for Scarlet Fever Patients.

The Exhibition, which will be arranged by Mr. J. Forsyth Johnson, Horticultural Director of the Alexandra Palace, will consist of 10,000 ROSES from the gardens of the principal growers, arranged with Ferns and other accessories in an artistic manner, and of a Competition confined to Amateur Growers.

All Roses to be grown by Exhibitor, and exhibited in boxes to be shown as cut from the tree. Any buds and leaves which are left, but no loose leaves to be added. Added foliage will disqualify.

All the exhibited Roses, unless reserved, will be sold at fixed prices, and delivered at the close of the Show, at 7 P.M.

All exhibits to be ready for judging by 10.30, or they will not be eligible for competition.

Entries to be made on or before June 27, addressed to the Secretary, Mansion House.

Carefully saved only from exhibition flowers, 100 seeds 2s. 6d.; per packet, 6d. My collection of Pansies grows, &c. 1st Prize at the Exhibition of 1881. Price LIST forwarded gratis and post-free on application. FRÉD. ROEMER, Seed Grower, Quedinburg, Germany.

Special Cheap Offer. E. VERVAET and CO., Mont St. Amand, Ghent, beg to offer the following: LATANIA BORONICA, fresh and most healthy seeds, 10s. per 100 seeds. COCOS PLUMOSA, fresh and most healthy seeds, 12s. per 100 seeds. LATANIA BORONICA, in store pots, strong seedlings, 8s. per 100 plants. EUTERIA, 1882, nice plants, in store pots, 6s. per 100. COCOS PLUMOSA (the graceful), nice plants in store pots, 20s. per 100. Immediate orders are solicited.

PRIVATE EXHIBITION OF ORCHIDS.

Mr. WILLIAM BULL'S Exhibition of Odontoglossums and other choice Orchids is creating so much astonishment and interest that it will be OPENED throughout this month to Patrons of the Establishment, and to those having received invitations. Several magnificent new kinds are in blossom.

Establishment for New and Rare Plants,
536, KING'S ROAD, CHELSEA, LONDON, S.W.

PAUL & SON, THE "OLD" NURSERIES, CHESHUNT,

Respectfully announce as ready for delivery the NEW CHESHUNT-RAISED ROSES.

H.P. WHITE BARONESS, a pure white, thoroughly double sport of the Baroness Rothschild.
H.P. PAUL'S SINGLE CRIMSON, a vivid almost scarlet seedling from Duke of Edinburgh.

Strong plants in pots, 5s. each.

The CHESHUNT SEEDLINGS, it may be noted, have always proved grand Roses when grown elsewhere.

NEW FRENCH ROSES, including the splendid Light Rose H.P. Helen Paul, Violet Bouyer, and others. The best lot for many years. 3s. 6d. each, 30s. per dozen.

New Single Roses, Miniature Roses, Old-fashioned Striped Roses, in pots, 1s. 6d. to 3s. 6d. each. **The Finest Lot of Extra Sized Roses** in pots ever held by the Firm, 30s. to 72s. per dozen.

The New and other Roses are now coming finely into flower. An inspection respectfully invited.

PAUL & SON, The "Old" Nurseries, CHESHUNT.

One Mile from Cheshunt Station on Great Eastern Railway.

EXHIBITION OF ORCHIDS.

B. S. WILLIAMS

Begs to announce that his Exhibition of Orchids, as previously announced, is still on view.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition contains large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LÆLIAS, ONCIDIUMS, CYPRIPEIDIUMS, MASDEVALLIAS, VANDAS, AERIDES, ANGULOAS, and other rare and showy ORCHIDS.

AN EARLY INSPECTION IS RESPECTFULLY INVITED.

VICTORIA AND PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

LYCASTE SKINNERI, CŒLYGNE CRISTATA, PHALÆNOPSIS VIOLACEA SUMATRANA, VARIETIES.

MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on TUESDAY, June 27, at half-past 12 o'Clock precisely, by order of Messrs. HUGH LOW & CO., a grand lot of imported plants, in the best possible condition, of

LYCASTE SKINNERI, CŒLYGNE CRISTATA, CATTLEYA TRIANÆ,
ODONTOGLOSSUM ALEXANDRÆ—selected specimens;

O. LUTEA-PURPUREUM, varieties; DENDROBIUMS, VANDAS, AERIDES, &c

At the same time will be offered AERIDES MACULOSUM and CRISPUM, extra fine varieties, in flower; PHALÆNOPSIS VIOLACEA SUMATRANA, varieties, semi-established plants, and other choice ORCHIDS.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,
LONDON, W.C.

The above Design is the first of its kind used in the Advertising Columns of any Newspaper, and is the sole property of JAMES CARTER & CO., notwithstanding any statements to the contrary.

THE

Gardeners' Chronicle.

SATURDAY, JUNE 24, 1882.

THE CHISWICK GARDENS.

THE Chiswick Gardens of the Royal Horticultural Society, the glorious old Chiswick of a generation ago, have been *en fite* during the past week, on the occasion of holding within the gardens the second annual exhibition of the Chiswick, Turnham Green, and District Horticultural Society. Small and comparatively insignificant as the show was in comparison with the splendid exhibitions which a quarter of a century ago made these gardens famous throughout Europe, it was yet like a relic of the past—as if the old glory would make an effort to reassert itself despite the changes which have come upon the time-honoured Society that still holds the gardens.

Amid all the vicissitudes through which the Society has passed during the past fifteen years, Chiswick has never failed, so far as its crippled resources permitted, to hold aloft the light that has always shed abroad in greater or lesser degree the quickening influences of practical work. When the heaviest clouds of impending dissolution appeared to overshadow the Society, as also in times when a brighter and more hopeful aspect lent a silver lining to the gloom, Mr. Barron never lost hope and courage; and Chiswick has for years past, under his intelligent supervision, shown a remarkable vitality in the way of practical work, the actual value of which has been much better understood and appreciated by those who make a point of visiting the gardens than by those who seldom go there. The columns of the *Gardeners' Chronicle* not infrequently give prominence to the nature and scope of the practical work done there; but it is only a small portion of it, and that not its most valuable portion, that finds its way into public print. Unfortunately there are now no published *Transactions* of the Society to keep the Fellows and the horticultural public generally *en rapport* with the Superintendent of the Gardens and his useful and increasing work.

It is not too much to say that Chiswick is now exceptionally full of interest for the horticulturist; while the *beau monde* and the mere loungeur can find much to satisfy what sense of the perception of decorative beauty they may possess. The large vinery as well as the smaller houses devoted to the culture of Grapes are in admirable condition, and the Vines bear crops of great promise. Outdoor fruits are of a more variable character in regard to crop. The south wall of cordon Peaches and Nectarines show very large crops of fruit, and though blight has been plentiful, the trees are in good condition. Cordon Cherries on the west wall show a partial crop. The fine collection of pyramidal Pears show in the majority of instances a very good crop: the low bush trees from Mr. Rivers are very full of fruit. All the bush trees of Apples of small size are in the same category; the larger and more exposed trees have but very little fruit. It might be reasonably inferred from this that the gale in early spring had the effect of either

tearing the blossoms from the trees, or rendering them barren. Cordon Apples are also bearing good crops of fruit. As is unfortunately usual at Chiswick, owing doubtless to its liability to suffer from spring frosts, the crop of Plums on exposed trees is practically *nil*; one wall tree of the fine old Victoria Plum has, however, an exceptionally heavy crop of fruit. Currants and Gooseberries have good crops of fruit, but the former are much affected with blight. Strawberries are a good crop, fine weather being required to mature the fruit. A variety named Pauline is worth noting as an early variety, the fruit long, quite 2 inches in length, and very ugly. This variety makes only small plants, but they fruit freely. In the vegetable garden there are excellent trials of the newer Peas and Potatoes, both of which are very promising; also of Lettuce, Tomatoes, Shallots, &c., that improve daily.

It is scarcely necessary to go into details as to the occupants of the various plant-houses. There is now an abundance of flowering plants of a widely representative character, all in excellent condition and well worthy an inspection. The Chiswick houses are never without something of more than ordinary interest, and many an old favourite of years ago that has become almost lost to cultivation occasionally appears in fine form at Chiswick, making one regret that so much of beauty and fitness should have fallen away into the bye-paths of neglect. Just now there are interesting trials of Begonias, Lantanas, and Ivy-leaved Pelargoniums, that in all probability can nowhere else be seen to such excellent advantage—Gloxinias, zonal Pelargoniums, Mignonette, &c. The frames are replete with plants of almost countless variety. In the open ground there are beds upon beds, and patches of hardy and half hardy plants of a very varying character. Violas, seedling Pinks, Canterbury Bells, Sweet Williams, Foxgloves, Antirrhinums, &c., all appeal in their best forms for a passing tribute of admiration. The rockwork is studded with floral gems of interest; and in the depth of winter as at midsummer it is never without some sweet floral visitant. The circling year, at all times and seasons, witnesses some "star of earth" answering in harmonious service to some glittering speck in the boundless vault above.

This is but a rapid and necessarily imperfect epitome of the leading features of the Chiswick Gardens. During the next three months, no practical horticulturist should visit London and go away without seeing Chiswick. He will have missed a treat and a lesson if he does so, especially if he bear in mind the numerous obstacles which the embarrassed state of the Society necessitates. Let us, in conclusion, bear testimony to the valuable services rendered by the heads of departments at Chiswick, who make up Mr. Barron's responsible staff. They appear to second his efforts with alacrity and intelligent co-operation. There is in such a place the constant necessity for a painstaking supervision of an immense number of valuable details. Herein lies one of the chief elements of success; and when the *entente cordiale* between superintendent and staff is perfect, there will be but the smallest hitch in the working of the daily round of routine duties which form the foundations of success.

New Garden Plants.

NEPENTHES ATRO-SANGUINEA.

Our illustration of this hybrid (fig. 125) was taken in the establishment of Mr. B. S. Williams, who states in his *Catalogue* that it is a garden hybrid of American origin, probably a cross between *N. Sedeni* and *N. rubra*. It is one of the richest coloured Nepenthes we have ever seen, being of a deep reddish-crimson and much richer than *N. sanguinea*. The pitchers

measure about 6 by 2½ inches, and are reddish-crimson slightly spotted with yellow, pointed at the base, distended at the lower half, cylindrical above; wings broad, fringed, mouth ovate acute slightly prolonged towards the lid and surrounded by a flatish rim marked with close ridges, some red, others blackish; lid about the size of the mouth of the pitcher, oblong emarginate, with radiating veins, and a simple spur at the base.

ODONTOGLOSSUM ASTRANTHUM, Rehb. f.

This rare species has appeared once more in the collection of Mr. O. Schneider, Cromwell Range, Wiltson Road, Fallowfield, near Manchester. The fine inflorescence just now to hand has very much brown colour on the disc of the lip. The plant is very chaste indeed in its colours. The star-like flowers are whitish-greenish-sulphur, with sepia-brown streaks and blotches, and it is only the base of the column that is decidedly orange, with a few reddish-purple spots. The largest flowers I ever obtained came from Mr. H. Salt. A sketch in colours made in Ecuador by Dr. Krause, and kindly sent by Messrs. Backhouse, shows a white lip, with red blotches. I candidly confess that I have not had a very satisfactory experience with many of these sketches, and the origin of the discrepancies may not so often be attributed to the difference of insolation, &c., as to the poverty of colours of the traveller. My wild-grown specimens are from Messrs. Wallis, Dr. Krause, and C. Klaboch, one of the numerous Roelian nephews. *H. G. Rehb. f.*

ODONTOGLOSSUM VEXILLARIUM WOTIANUM, n. var.

A glorious variety! It is of the finest, richest white, with a light yellow base to the lip, and three short reddish-purple lines in front. There is a light purple dot at each side of the base of the petal, and the anther and sides of flower are purple, too, as are two short lines on the base of the side sepals inside. It is nearest *Odontoglossum vexillarium leucoglossum*, but well distinguishable. I dedicate it with pleasure to Messrs. Wiot, of the old firm, Jacob & Makoy. *H. G. Rehb. f.*

SUMMER GROWTHS.

THE trees which so widely suffered from the terrible force of the April hurricane are now recovering from its effects, and we see, as an undoubted phenomenon in vegetable life, Oaks, Elms, Chestnuts, and other badly injured trees, just now putting on new growth and leafage as though it were April and not June. Summer growths on the part of deciduous trees are common enough, although very largely dependent upon the rainfall and geniality of the season, but such a summer development of new growth as is just now taking place is indeed an unwanted feature such as few have seen in the past and few may see again. Indeed, the cause of this unwanted appearance is unwanted also. Fierce cold blasts may blow and rage with terrible force through the winter months, and though we shiver and suffer we feel no surprise. It is when the elements war so furiously against the tender vegetation of spring, as they did in April last, that we wonder and realise that we are indeed in the midst of strange phenomena. The trees that seem to us to be made of the sternest and most defiant stuff, were so literally stricken and chilled, that their very life's blood seems to have been arrested, and congealed. The destruction of the leafage wrought almost the same effects as autumnal frosts and growth for the time literally ceased.

No more unusual sight has been presented than that but a week or two since offered by large breadths of sturdy vigorous Oaks standing in Windsor Forest, upon which, though it was reputedly the leafy month of June, yet there was not a leaf visible. The fierce wind had killed every spring bud and leafy shoot, and not a green speck was to be seen. But even then there was to the experienced eye evidence of an universal burst of leafage soon, for the swollen brown leaf-buds glistened in the sunlight as they will in the month of March, when the winds are soft and the sun shines out pleasantly. The great reaction was then setting in, and is now in its fullest vigour, and though late Nature will do all that she can to recoup herself and reclothe the naked woods with luxuriant leafage. There is an old notion, more or less true, that when the stem of some noble tree has been severed with a saw that experts can tell of each season's growth by the width

or otherwise of the woody rings seen. If, however, some such expert should, half a century hence, strive to penetrate into the secrets of the past, and find that 1882 gave but a narrow ring, he would perchance but indifferently guess at the cause, for it is, indeed, as singular as it is unwanted.

A "DRIPPING" TIME.

THIS is the golden opportunity of the gardener. If a time of warm invigorating showers at this season of the year comes a little inopportunistly for the farmer who is making his crop of hay, it is of great advantage to the gardener—provided, of course, that the showery weather is not too long in duration and too cold in temperature. Just now the market gardener is getting out his Brussels Sprouts, Cauliflowers, Vegetable Marrows, &c., while his Runner and Dwarf Beans, Lettuce, &c., are greatly benefited by the nourishing rains. There is nothing like getting a good start with such crops, and a showery time for planting out is also a great economiser of labour. To the gardener such a time is also a welcome and beneficial one. He, too, is bringing on succession crops, and is also planting out his winter stuff, &c. It is true that he has a command of water that does not generally fall to the lot of the market gardener; but the beneficial showery time is, for obvious reasons, not less advantageous.

Those who do spring gardening on a large scale are just now dividing and planting out in the reserve garden such useful spring-flowering perennials as Daisies, Pansies, Violas, Aubrietias, Arabis, Primroses, Polyanthus, and the many other subjects used for this purpose; and if this be done during a time of rain, or immediately preceding it, the divided pieces soon draw root and make abundant stock. A showery time during June greatly helps the newly-planted subjects in the flower-garden, and lays the foundation of a display throughout the summer, the attractiveness of which is greatly augmented by the rain. It is also a time of hard pelting showers that beat down the surface soil, and this bakes in the sun till it takes the form of a thick crust. The hoe, or any tool that can break the surface, is then called into requisition, and with great advantage, for not only does it further the necessary aeration of the soil, but it keeps down the growth of weeds. Probably gardeners, as a rule, undervalue the use of the hoe in the garden; and yet a loose surface is of the greatest value in a time of drought. No one knows this better than a nurseryman; a deeply-stirred surface at a time of drought, provided the roots of trees and plants are not unduly interfered with, is the salvation of some growing crops. There is no more genial growing time than showers alternating with sunshine; but both should be warm, and then the plants answer to the invigorating influences, giving cause for man and beast to rejoice.

DERNCLEUGH.

THIS very handsome residence, the property of Godfrey Ermen, Esq., is situated between Dawlish and Teignmouth, and is approached off the Teignmouth road. The property has been lately acquired by Mr. Ermen, who within the last three years has laid out new gardens, erected new plant and forcing houses, and otherwise embellished and ornamented the grounds. The entrance to the kitchen garden is beautified with borders of choice hardy flowers and ornamental and flowering shrubs, Conifers, and hybrid Rhododendrons. The Wallflowers and Stocks have attracted a large share of attention lately, owing to their excellent quality, profusion, and size of flowers, which is mainly due to a liberal system of cultivation adopted by Mr. Pook, the gardener. *Veronica*, *Hydrangea*, *Eaonymus*, *Lycyestera formosa*, *Dentia scabra*, *Escallonia macrantha*, *Weigela rosea*, *Althea frutex*, and many other flowering shrubs luxuriate in this climate, close by the sea, and are no doubt materially assisted by the new virgin soil and cultural attention which they receive in order to hasten their development into established specimens. Indeed, their progress has been so rapid that it seems incredible, looking at the size of the trees and shrubs, and the numbers of hardy flowers, that what is now a beautiful garden was only a half-cultivated field some three years ago. But such is the case; and what has been accomplished here in so short a time may be done elsewhere in scores of cases, if only the means are provided, and there is equal energy displayed in carrying on the work.

FIG. 125.—NEPENTHES ATRO-SANGUINEA. (SEE P. 826.)

Upon the slope of a hill a new orchard of fruit trees has been established Devonshire-like—for it is a remarkable fact that nearly all the fruit orchards in the county occupy slopes—no doubt for the excellent reason that frosts and fogs are not so likely to damage the blossoms during the flowering season. On the summit of the slope there is a new range of forcing-houses built by Messrs. Shapter & Son, of Dawlish, who have had much experience in bothouse building in the neighbourhood. The crops of Grapes are a great success, and, owing to the fine elevation of the houses, and their contiguity to the sea, the very highest degree of colour may be expected when the Vines have reached the proper age. As it is, notwithstanding their unusual vigour, the bunches are numerous, and are large and well formed. The sorts are Black Hamburgh, Foster's Seedling, Frontignan, Mrs. Pince's Black Muscat, Muscat of Alexandria, and others. Two soft-water tanks have been provided for supplying water to these houses; indeed, nothing seems to have been omitted that is at all calculated to promote success in Grape growing. Smaller houses for the cultivation of Cucumbers, pot Vines, and plants, are also furnished with the best modern appliances, which tends in a great measure to facilitate all operations, and is productive of the most satisfactory results.

In another range of three divisions, chiefly devoted to Peach growing, there are some experiments in glazing being tested, which are worthy of notice. One of the divisions has been "double glazed," the distance between the two sets of squares being three-eighths of an inch. The inner squares "butt," that is to say, the ends of the squares nearly touch, while the outer squares "overlap" each other in the usual way. The advantage of this system of glazing is, that a temperature of 8° higher is obtained than under the single system. Naturally there is less loss of heat by radiation, but the question is—are the trees not liable to excessive heat in summer? So far as three years' experience at present shows (apart from the higher temperature secured in winter without the application of fire-heat) the trees grown under the double system of glazing are in superior health generally, and are better furnished at their base. But here again it would probably be hasty to ascribe this success to the double system of glazing. It is generally cold draughts admitted through the front ventilators of a house that are fatal to the furnishing of Peach trees, rather than anything else. Upon the whole, the system may be advantageous where fuel is expensive, but the house should be freely ventilated in order that healthy volumes of pure air may be admitted in warm weather, and in the case of early houses the sashes should be "movable" altogether, so that perfect rest may be secured after the leaves have fallen.

There is a good Peach wall planted with young Peach trees, which are much exposed to storms from the sea, and which grow fairly well, but which will not be satisfactory until the wall is covered with glass. A roomy house built against a wall of this kind would grow pot fruit trees to perfection, besides never missing a crop from the hack wall, and Tea Roses could be trained up the rafters. The fact is, small houses are proportionately dearer than good-sized roomy ones, and are worse to work, and far less productive. They are soon hot and soon cold, and rapid changes of temperature are very dangerous to fruit trees in bloom, and, indeed, are not beneficial to them at any time. The house stands on an elevated site, about 150 feet above the level of the sea.

The terraces are steep and smooth, and the lawns, enclosed by flowering shrubs and trees, are very beautiful. The conservatory is gay with seasonable flowers, but the flowering shrubs are more striking because of their great size and luxuriance of leaves and flowers. Veronicas grow into fine bushes, and Azaleas, Camellias, Ericas, and other plants grow and flower freely in the open borders; but it should be added the climate is most genial and the situation well sheltered. The view from the terrace is splendid towards Dabbicombe Bay, Berry Head, and the "Ore Stone"—an immense rock standing out in the sea, and the spire of St. Mary's Church, Torquay. In Lindsay Park, which is divided from the private grounds by "Smuggler's Lane," Mr. Ermen has laid out tennis lawns, rockeries, and a handsome summer-house, built in spar and Ifaldon flint, which is a pretty addition to a garden and grounds that promise at no distant date to be of a truly beautiful and interesting description.

LETTUCES.

NOTHING in the vegetable way is more esteemed during the summer than Lettuce, but to have them crisp, juicy, and succulent they require special treatment; for, though they may do very well under the ordinary mode of treatment during the earlier part of the season, they will not bear transplanting now without suffering such a check as will completely stop their growth, and cause them to run up to seed. The great thing to avoid in the cultivation of Lettuce is the severance of the tap-root, which must of necessity take place if the young plants are pulled from the seed-bed; and to save doing this the seed should be sown where the plants are to grow, as then they strike down, and are able to endure the great heat or changes of weather. Another important thing in the management of Lettuce is to give them rich soil, or plenty of manure, which should be of a mild nature, and thoroughly decomposed, as in that state they can feed on it at once. In digging the manure in the deeper, in reason, the ground is dug up the better; but if light, it is as well, after the digging, to tread it over before raking down, so as to prevent it lying hollow and loose. With the surface made firm and smooth all will be in readiness for seed sowing, which should be done in shallow drills drawn at about 15 inches apart. To save waste of seed, and also labour and trouble in thinning, it is a good plan to dot the seed in in small patches, leaving a space of a foot or so between each patch, which is the proper distance for the plants to stand and grow, and gives plenty of space for them to develop themselves, and form large solid hearts. The thinning must be done betimes, and should be carried out immediately the plants are large enough to show which is the strongest and best, as then there is little or no disturbance of the one left, which then have every chance of growing from the first start to the finish. To afford them every encouragement to do this sewage or liquid manure should be given after they have attained about half their size, which will help them on amazingly, and the quicker progress they make the finer will the quality be.

During the heat and height of summer the best place for Lettuces is a half-shady border away from the roots of trees; and where a cool situation of that kind cannot be afforded them, it is a good plan to stick a few evergreen branches along the sunny sides of the rows, or run a piece of old fishing-net over the tops, and support it there about a yard high, where it will afford the requisite shade, and prevent the plants becoming distressed from the fierce solar rays. Later on one of the most suitable situations for Lettuce is between Celery trenches, along the centre of the flat ridges, as there they get a great depth of fresh soil, and by having so much room, with plenty of light and air, attain a great size. As to sorts, there are none for summer work equal to the Cos sorts, and one of the best, if not the very best, among these is the old Paris White, which hearts in well of itself, without tying, and when ready for the salad-bowl is tender, crisp, and delicious. Among the Cabbage kinds the Victoria and Neapolitan are as good as any, and both are fine large Lettuce that have close solid hearts, which are of excellent quality. To stand the winter none are better than Hicks' Hardy Cos and the Bath Brown Cos, both of which should be sown towards the end of August, and the former best plants planted close under the foot of a sunny wall, or on a warm dry border facing the south, where, unless the winter is very severe, they will stand all frosts, and be fit for use very early in spring. *J. Sheppard.*

PLANT PORTRAITS.

CATALPA KEMPFERII, Sieb. and Zucc., *Bot. Mag.*, t. 6611.—A hardy tree with cordate ovate scarcely lobed leaves and panicles of irregularly funnel-shaped pale yellow flowers sprinkled with small red spots. Japan. Hort. Kew. For a notice of the cultivated *Catalpa* see *Gardeners' Chronicle*, p. 650, vol. xiii.

CATTLEYA VELUTINA, *Orchid Album*, t. 26; *Reh. l.*, in *Gard. Chron.* 1870, 140, &c.—Flowers 5 inches across, fragrant, segments oblong, tawny, with reddish-brown spots, side lobes of lip erect, whitish, central one much larger, spreading, whitish, marked with lilac veins. Brazil. Coll. Sir Trevor Lawrence.

CYMBIDIUM PARISHII, *Orchid Album*, t. 25; *Reh. l.*, in *Gard. Chron.*, i., 338, x., 74.—Flowers 3½ inches in diameter, segments oblong obtuse, lateral lobes of lip erect, white, central lobe flatish, roundish,

white, with a yellow blotch and numerous purplish-brown spots. Mouline. Hort. Day.

MASCARENHAISIA CURNOWIANA, Hemsley, *Bot. Mag.*, t. 6612.—An Apocynaceous stove shrub with oblong-acuminate glabrous leaves and terminal turesses of rosy-pink funnel-shaped flowers each about 2 inches across. Madagascar. Hort. Low.

ODONTOGLOSSUM BREVIFOLIUM, *Orchid Album*, t. 27.—Flowers panicle, each about 2 inches across, segments broadly ovate, bright chestnut-brown edged with yellow, lip small, wedge-shaped, yellow, with a pale reddish-brown chevron shaped blotch.

ROSE STAR OF WALTHAM, *Journal des Roses*, March.—A poor illustration, which gives a very inadequate representation of a fine Rose. Of course it is a mistake to ascribe its introduction to the year 1835.

SCUTELLARIA HARTWEGI, Denth., *Bot. Mag.*, t. 6615.—A slender perennial with cordate ovate lanceolate leaves, purplish on the under surface and terminal racemose cymes of rose coloured labiate flowers with a long slender tube. Andes of Quito. Messrs. Veitch.

TALAMIA CANDOLLEI var. *GALEOTTIANA*, Blume, *Nat. Mag.*, t. 6614.—A stove Magnoliaceous shrub, from Java, with oblong lanceolate leaves; flowers 3½ to 4 inches in diameter, pendulous, with oblong greenish sepals and numerous yellow petals as long as the sepals. It is the *Magnolia Galeottiana* of hort. Van Houtte. Hort. Kew.

WAHLENBERGIA SACCOLA, A. DC., *Bot. Mag.*, t. 6613.—A low growing annual with tufted linear oblong leaves, erect leafless flower-stalks bearing solitary bell-shaped flowers. New Zealand. Mr. T. Anderson-Henry.

ZYGOPETALUM GAUTIERI, *Orchid Album*, t. 28.—Flowers 2½ inches in longest diameter, segments oblong acute, green with brown blotches, lip large, spreading, three-lobed, violet. Brazil. Hort. Massange.

FLOWERS IN SEASON.

BENTHAMIA FRAGIFERA.—This lovely tree is now a charming picture in the grounds of the Earl of Mount Edgecumbe, Cornwall; one plant in particular, over 30 feet high, is clothed with a profusion of its large yellow blossoms, which are peculiarly beautiful, owing to the situation. The plant is situated midway upon a slope overlooking the sea in an open space evidently cleared of underwood as an honour conferred upon the floral gem. Its branches droop gracefully under a burden of rich golden flowers, which are sheltered by abundant foliage of other trees at some little distance off. It is viewed from a drive which stands at a considerable elevation above it, and will be an object of interest from now until winter, when its fruits will be ripe. There are not many places where the winter Strawberry will succeed as well as at Mount Edgecumbe, but it would surely be worth while to plant it more extensively in the South and West of England upon trial.

CITRUS LAXUS.—Apart from the utility of this fruit for massing in beds in pleasure-grounds, where it has a fine effect during the present month, it is one of the most pleasing objects for covering banks or planting by the sides of Orchis against Tives or other creeping plants. In parts of Devonshire and Cornwall the flowers develop to an extraordinary size, owing, no doubt, to the geniality of the climate, and flower continuously over a period of several weeks. The flowering season is of much longer duration where the plants are not fully exposed to the sun during the hottest part of the day.

ROSE OF CHINA PEONY.—Few hardy flowers have so rapidly advanced in public estimation during the past two or three years as the finer varieties of those lovely *Peonies*. Only lately, indeed, have they been tolerated as a cut flower at all, but now whole groups of them may be seen in many gardens, and charming groups they make. At Saltram, the Earl of Morley's fine garden, near Plympton, Devon, there is a line extending the whole length of a long border of the variety above-named, which are specially cultivated for cutting purposes. The variety is happily named; it is "rose scented," and is shown as a cut flower. There are no other hardy flowers to compare with them for sending long distances, or that will turn out of a box so bright and fresh after a long journey, and for this reason, if for no other, they are destined to become very popular before long.

CHRYSANTHEMUM FRUTICOSUM.—When a plant becomes so common that nearly every market grower in the country has a stock of it one would think that that plant has seen its best days, but the plant in question is more than a market grower's plant. There will be hundreds of it grown by-and-by where only single plants are grown now. The reason is not obvious to the many, because plants that are introduced by a flourish of trumpets and said to yield fashionable flowers, are not kindly taken to by the masses at first. The greatest gain will be to the poor cottager and amateur hereafter, when it is discovered that the plant will flower all the year round in the open air in mild seasons. Plants grown from a single cutting in the spring, if planted in an ordinary rich soil, will grow 4 feet through in a season, and this is one important advantage to people of limited means. In the spring garden it may also be used, where it will have an incomparable effect at a time when spring flowers are nearly over, and the summer show is not at its best. At Mount Edgecumbe, Cornwall, there are two circles in the flower garden filled with this plant, which at the present time is something fascinating. At a long distance off one wonders what the masses are, so densely are the flowers packed together, and these same plants have been flowering in the same place for nearly twelve months. Making due allowance for climate it cannot be too widely known among all classes of the gardening community that plants that are so cheap and so easily grown may be had in flower during the greater part of the year, and especially that it is worth risking a few plants out-of-doors, which, if the winter be not severe, will yield a great profusion of flowers during the spring months.

SOLANUM JASMINOIDES.—As a fast-growing creeper and a pretty one this plant should be extensively grown by amateurs and cottagers desirous of covering trelliswork or naked, unsightly walls, in a natural-like manner. At this season, when growth is progressing rapidly, the long shoots entwine and interlace each other, and the little white blossoms are about equal in number to the leaves, presenting a very pleasing surface, that would be welcome where people hardly know what to employ to cover objectionable places the quickest. In a good climate the plant will continue to flower more or less from now up to Christmas.

CALCEOLARIA KAYII.—Twenty years ago or less this variety was grown everywhere, but since *Calceolarias* have been so much affected with disease in hot summers, it has almost died out of cultivation. *Aurea floribunda* and *Golden Gem* are now the favourite yellows employed in the flower garden, and the latter is undoubtedly the best of the yellows for the flower garden proper, because of its robust compact habit and excellent constitution. It lives and thrives where other varieties fail. But still the old *Kayii* is a taller grower, and makes a grand border plant at this season. Its presence in a flower border puts many other plants in the shade until masses of summer flowers come into full blow. Around Exeter the plant has lived through the winter—if we can say we have had a winter—and is now a very ornamental border plant.

DEUTZIA SCABRA.—In sheltered situations near the seacoast in Devonshire this useful shrub grows to an extraordinary size beyond anything that is ever seen or thought of in northern counties. Writing from actual observation of a plant having several stems upon the same stool, which is from 12 to 15 feet high, and three times as much in circumference, it seems strange that the plant is not more extensively planted. The drooping little sprays of white flowers are so effective in the shrubby border, and so useful for cutting as well, that it is difficult to understand why over a hundred common *Rhododendrons* are to be found for every one of this *Deutzia*. No greater ornament can be desired in the shrubby border during the present month, where, among green Hollies, or green of any kind, the mass of white flowers look peculiarly bright and lively.

CASSIA CORYMBOSA.—This useful free-growing plant is more frequently found in collections in the South and West of England than in the North; and its leaves, which are somewhat *Jasmine*-like in habit, but more vigorous, are of a very ornamental character. The flowers are deep yellow, and are

freely produced, which renders the plant a desirable and attractive subject for the conservatory during the summer months. It also makes a good exhibition plant, and owing to its freedom of growth ought to make a useful specimen for exhibiting at local shows. A nurseryman from Dorchester showed a grand specimen of this plant at Weymouth two years ago, which attracted hosts of admirers—as well it might, for it was really the finest example of a flowering plant at the show. Grown in small pots it is a useful subject for grouping in show-houses, and it is also suitable as a sitting-room plant.

MILDEW IN VINERIES.

THERE is no other disease to which the Grape Vine falls a prey which spreads with such amazing rapidity, or that is more injurious in its consequences to a crop of Grapes, as the Vine mildew. It is, happily for all concerned, a rare thing to meet with Vine mildew in the bracing atmosphere of the Northern or Midland Counties; but the Southern and Western Counties of England do not enjoy the same exemption from its attacks. Cultivators who are unfortunate enough to be subject to the attacks of the disease annually are sorely puzzled at times to arrest its development, which in some cases is next thing to impossible. There are of course certain well known conditions which tend to breed or develop the disease, and of these practical gardeners are fully aware, and if provided with the necessary machinery the enemy is soon brought to bay; but there are circumstances under which even the best practitioners are baffled in dealing with the enemy. What are the conditions that tend to develop the disease, and what is the remedy? Seldom do we hear of mildew in a vinery occupying an ordinarily favourable situation, and that is well heated and ventilated. But in the genial climate of the South hot-water pipes are not considered so important in relation to horticultural buildings as they are in northern latitudes, and the consequence is, that many vineries are not heated at all, and thus the gardener is left to fight a losing battle with the foe.

We will suppose that there is a depression in the weather for a week or more, that the temperature falls rapidly, and that the atmosphere continues stagnant for a time; the inevitable consequence must be that mildew will attack the Vines, and the gardener is practically left without a remedy to extinguish it. Of course these remarks are based upon the assumption that the atmosphere of the South differs from that of the North, inasmuch as it is more relaxing; in other words, that it tends to promote the development of the disease, and that it has a greater and more powerful tendency to do this than the atmosphere of the North. Assuming then that this is the case, there are a few points which—to gardeners and their employers—appear to be of paramount consideration. In the first place a vinery should not be built in a low, damp situation, and in the next place it ought at least to be warmed with a flow and return 4-inch hot-water pipe to enable the gardener to make a dry atmosphere by artificial means, when the natural atmosphere out-of-doors is of that dubious character which, to a clear-sighted cultivator, is calculated or likely to bring in its wake an attack of the disease. Our forefathers not being as well informed as we are, have built many low houses—houses with flat roofs—in the worst situation in the garden, where not only fogs and heavy dews hang about, but also where there are but slender means provided for ventilating. Now, it is a fact that these houses—and not a few of them—exist, and that the Vines are attacked with mildew every summer as regularly as the swallows return to England.

The gardener either knows the only remedy, or, if he is an amateur, he asks his wisest neighbour, who tells him to dust the affected parts with sulphur, and to keep a drier atmosphere. This is very good advice as far as it goes; but if the house is not heated, and cold, damp weather continues, the sulphur puff is of but small service indeed. Well, the thing goes on year after year, and people sit and wind their fingers, so to speak, while the disease spoils more fruit in a single season than would, if properly grown and marketed, compensate for heating the house. How far this state of things is due to gardeners themselves it would be unfair to conjecture, but it does seem an aimless business to build houses, and be at the expense of cultivating Grapes up to a certain point, and then let the crop spoil when the remedy is so cheap and obvious. There are, however, cases where the Vines are old and entangled, where the roots are in an unsatisfactory condition, through bad drainage or other causes, which cannot be cured except by grubbing up and replanting young Vines in well-drained borders. This will cure the worst case of mildew, and the undertaking will more than pay for itself the year after planting, in capable hands. *W. Hind.*

A TOWN GARDEN.

THE accompanying plan (fig. 126), may be serviceable to those who have to design town or suburban gardens of the usual oblong form. It will be seen that there is a forecourt which faces a suburban road, so near to the smoke of a manufacturing suburb that gardening is carried on under difficulties. At the back of the house are stables, and the usual offices, while at the far end are a summer-house and a green-

not suited for Rhododendrons, which would otherwise be in place in this situation. On the central lawn are various beds filled with Hollies and Aucubas of many varieties, which do well in the locality, and other ornamental shrubs, and bordered, some with the choicer hardy perennials, others with bedding plants. A few specimen shrubs are dotted about on the lawn. The whole forms one of the prettiest suburban gardens for the size that we know, and it is so planned that at all seasons there is something to admire. The surface, with the exception mentioned, is nearly flat, and the area about 7525 feet.

FIG. 126.—A TOWN GARDEN.

house. A shrubby border, with many well selected shrubs, bounds the whole, and at one end, at the left-hand side, near the summer-house, the border rises gradually to a "wild bank" not indicated on the plan. This wild bank is, nevertheless, one of the features of the garden, being merely a raised mound devoted chiefly to the cultivation of Ferns and many of the more showy and interesting British plants collected by the owner during many a summer ramble in various parts of Britain, and which thrive well in spite of the smoke. The border in front of the green-house is filled with evergreen shrubs; the locality is

EASTLEIGH.

TRAVELLING over a picturesque country, and amid scenes of unrivalled beauty for some time past, I was agreeably surprised to find compressed within a comparatively limited space so many horticultural attractions as may be seen in the beautiful garden of Captain Paul, near Teignmouth, South Devon. The garden upon the east side is well sheltered by a good block of Pines and Elms, parallel with which the flower garden—a long green strip at the base of the east terrace—is charmingly laid out and planted. Upon the east terrace walk arches of the Japanese *Honeysuckle* and other creepers are very effective, and the south terrace is adorned with numerous vases filled with summer flowering plants. At the base of this terrace there is a good sweep of lawn, soft as a Brussels carpet to the tread, and partly encircled by groups of hybrid *Rhododendrons* the leaves of which are the picture of health itself. Upon the west side there is a neat conservatory and fernery adjoining the former, which is gay with *Calceolarias*, *Hydrangeas*—the hardy kinds in pots, and Miles' hybrid spiral *Mignonette*, a first-rate sample. The walls of the fernery are covered with virgin cork, and Ferns planted in pockets droop gracefully down the walls. The collection consists of *Asplenium*, *Nephrolepis exaltata*, *Lygodium scandens*, *Nephrodium corymbiferum*, and a good many *Adiantums*, and other dwarf Ferns, in all making a very distinct and pleasing sight, from the more showy subjects in the conservatory. *Habrothamnus elegans* is hardly out-of-doors here, and the belts of shrubs are marvellously luxuriant, and as regards formation and outline elegantly conceived.

In a sheltered portion of the grounds the samples of *Azalea arvensis*, the old *Azalea indica*, *Ghent Azalea*, hardy *Heaths*, and *Pernettyas* indicate the remarkable gentleness of the climate as compared with other parts of the kingdom. From the terraces there is a clear view of the Haldon Hills and the bay opposite Torquay—a charming sight upon a bright day. A walk through the flower garden reveals the fact that climate and shelter, together with taste and judgment, work wonders with plants as regards arrangement and effect. The plants have already nearly filled the beds, and the blending of the colours is very pleasing to the eye, either from the terraces or upon closer examination. Quiet, pleasing harmony is the principle of arrangement, which is well shown off by so many fine trees and shrubs, naturally formed arches, bowers, and summer-houses, either made or clothed with *Laburnums* or other drooping plants or creepers. Through one of the latter an entrance is effected into a modern span greenhouse, containing a good collection of plants, among them a large batch of *Carnations Souvenir de la Malmaison* and *Lady Middleton*. The latter variety is rose-pink, the flowers are large, and altogether the variety is a good companion for the old favourite *Malmaison*. The back wall is covered with *Bougainvillea glabra*, *Trachelospermum jasminoides*, *Lapageria alba* and *rosea*, and *Camelias*; and the pot plants consist of *Orange trees*, tuberous-rooted *Begonia*, *Woodwardia radicans*, *Pelargoniums*, both of the zonal and of the decorative section, which have been very showy for some time, and promise to supply a continuance of flowers still longer.

The south wall of the fruit garden is entirely covered in with glass, the centre portico or pediment and the two ends projecting from the front of the range; this gives the glass an ornamental appearance. In this range Peaches, Nectarines, Grapes, and Figs are the staple crops. Early *Bettrice* and *Early Rivers* Peaches are being gathered from standard trees, and later kinds will succeed them in the same division. Plums and Strawberries I omitted to mention, but suffice it to say that everything under glass, as well as out-of-doors, is not only successfully managed, but the neatness of the garden and the good order and liberality that appear to reign supreme lend an additional charm to one of the prettiest gardens and the best managed that I have met anywhere upon the South Devon coast.

PARKERSWELL HOUSE

DERIVES its name from a spring of that name close by, and is but a short drive from St. Thomas' station, Exeter. It is the property of W. Brock, Esq., who takes much interest in his garden, and spends much of his leisure time in company with his plants. From a purely horticultural point of view plant growing may be said to be its conspicuous attraction. The entrance is off the Top-ham Road, upon the south side of the house, where the lawns, trees, and shrubs are kept in excellent order. The evergreen Oaks are very fine, and the flowering shrubs are tastefully arranged, as also a piece of rockwork furnished with a good variety of Ferns and hardy plants. The houses, with the exception of a fine conservatory, are all within the walled-in garden, but there is no difference as regards order in any of them.

The greenhouse is the first of a range of houses, spacious and well-appointed, and is at present gayer than usual with a fine collection of Calceolarias, exhibited at Exeter a week or two ago. The strain (chiefly Smith's of Dulwich) is very fine, and the plants average from 2 to 3 feet through. The leaves are nearly as tough as those of young Cabbages, and quite as sappy looking, and the flowers are large and well-formed throughout. It is notable, however, that plants grown from a local strain are equal in every respect—quality of flower excepted. Trained Pelargoniums of the decorative class, hardy Heaths, Orange trees, and Lapagerias are grown and arranged in first-rate style, the Pelargoniums and Calceolarias of course making a fine display of themselves.

The next division is a Peach-house in which there is a good crop of Peaches, the old Noddles fruiting with more than usual freedom. The house is so constructed that there is room for a row of plants between the trellis and the front lights, and here there is a splendid show of Pelargoniums being brought forward for the coming exhibition. The plants are over 3 feet across, and consist of Prince of Pelargoniums and other show varieties.

Vines occupy the next division, and are bearing good crops, and young Vines in a house by themselves are making rapid progress, both wood and leaves being strong and healthy. The plant stove probably contains the best effort at plant growing. Croton Disraeli (a favourite variety about Exeter) is 5 feet through, and Croton variegatus, Lord Derby, and angustifolius are little short of the same dimensions. They are in reality very fine specimens, about as large as can be grown in the house. Their companions are fine Marantas, Alocasia intermedia and Lowii, Davallia Mooreana, an extra fine specimen of Nephrolepis davallifolia furcans, nearly 8 feet across; Vines, Dipladenia, Stephanotis, Allamandas and Clerodendrons—all very good specimens and promising to make very fine plants at no distant date. Palms, Fitcher-plants, and Dracaenas, together with many other foliage plants, are also observable in the collection.

But Mr. Brock is not content with the list of plants above mentioned, but is engaged in forming a collection of Orchids, of which there are two houses partly filled already. There are eighteen varieties of Cypripediums, a good stock of Dendrobium, Cattleyas, Saccolabiums, Calanthes, Phalænopsis, Cerebra cristata, Anthuriums, Masdevallias, and, in short, a collection in which representatives of all the leading and valuable species will be found in excellent condition.

The bulk of the plants are imported pieces, and Mr. Brock may be congratulated upon his success in securing so many good varieties of the different species in his collection.

As regards comm-mixte gardening, such as Cucumbers and Melon growing, the crops are plentiful, and in no case is there any appearance but of prosperity and abundance. The conservatory is a handsome structure, having creepers trained over the roof which are both graceful and pretty. Tacsoniaxonensis and Passiflora Imperatrice Eugénie are very fine, and flowering with their accustomed freedom. The permanent plants are large Palms and Dracaenas, Tree Ferns and Camellias, so that it is an easy matter at any time to make a good display with the addition of a few flowering plants. Mr. Rowland, the head gardener, is a persevering and successful exhibitor, and does everything well that he undertakes in plant, fruit, or vegetable growing.

The Herbaceous Border.

HARDY HERBACEOUS PLANTS.—Those who do not grow many hardy herbaceous plants have little idea of the great numbers there are that flower at this early season, or imagine what a grand display they make in borders or beds, and with a view to bring them more under notice I purpose making a few remarks on some of the best. The first deserving special mention are the Alstromerias, which are a very beautiful class of plants, having large heads of richly marked or spotted Lily-like flowers. To grow them well, Alstromerias require a light, well-drained, warm soil, and a sunny situation in some sheltered spot, as they make their growth early and are somewhat tender, and apt to suffer from spring frosts or cold cutting winds. The way to get them established, and ensure their safety during winter, is to plant deeply or sow seed where the plants are to remain, so as to avoid any further removal. Another fine old herbaceous plant that is making quite a show just now is Aster Amellus, with its large purplish-blue flowers and prominent disc. Delphiniums are a host in themselves, and for brilliancy of colour are unsurpassed, and quite eclipse everything else. D. cashmerianum is remarkably showy, and should be in every border, as also the old formosum, which is still one of the best. Campanula Van Houttei is a very fine thing, as it bears immense bell-shaped blooms quite 2 inches in length. For affording spikes for cutting to dress in vases, C. persicifolia alba is the most valuable, as the flowers are pure white and very elegant looking. Dictamnus Fraxinella is a most uncommon looking plant, with tall stately spikes of very singular looking blossoms that have a strong and agreeable odour. In soil that suits it the Dictamnus forms quite a bush some 2 or 3 feet high, and blooms with great freedom. One we have here has nineteen strong tall spikes that have a very stately appearance. Geraniums, such as the large blue platypetalum and sanguineum, form charming objects and are fine for rockwork where they can run and spread over in their own natural way. Potentillas, too, come in well for the same work and are very bright and telling with their profusion of vivid coloured Strawberry-like blossoms. Fankias are alike remarkable for their foliage and flowers, the spikes of which resemble Lilies in miniature and are of great service for cutting. F. ovata is perhaps the best and most suitable for this purpose, but all are good, and F. Sieboldi has magnificent leaves. Spirea palmata is grand with its lovely panicles of violet-pink blooms, and produces a splendid effect grouped with S. japonica or S. filipendula flore-pleno arranged in the front. The Ilcemorealis or Day Lilies are stately plants, the best among them being Il. Intea, which has rich yellow blooms that continue coming on for a long time in succession. Il. kwanso is almost too large for the herbaceous border, but is fine for planting in the foreground of shrubs or in semi-wild places to be left to itself.

It is not often we see Pentstemon flowering at this early period, but the winter having been so mild ours are now at their best, and very beautiful they are, and of extreme service for cutting. A packet of mixed seed affords no end of variety, and sown now and the plants wintered in pots in frames, they will be fine for next season. Too much cannot be said in praise of the lovely Iris, the Niphion or Spanish section of which and the German set are equal to Orchids, so singular and beautiful are they in their form and rich colouring. The common or flag Iris are very fine, but they are quite eclipsed by the bulbous kinds now in the height of their beauty. To keep them safe through the winter they require light sandy soil and a tolerably dry situation, or the bulbs rot. The common kind on the other hand delight in wet, and only succeeds really well where it can have plenty of moisture. Aquilegias are and have been very gay, the Rocky Mountain species being by far the best. Unfortunately A.erulea, the finest of all, is rather a misfit doer, and to keep it going it is necessary to sow often and raise fresh plants to replace others, as they die out and go off. A. chrysantha is much stronger, and the hybrids partake more of its vigorous habit, but are without the finish and ornamental appearance the long spear-like appendages give to their parents. Pyrethrum are simply invaluable, as they are quite

equal in form and shape to Chrysanthemum or Asters, and as rich and varied in colour. Plants have been quite ablaze for a long time and have afforded plenty for cutting without any apparent loss to the borders, so full have they been with bloom. These double Pyrethrum should be largely planted, as they are among the most showy and useful subjects we can have. Pæonies as usual have been gorgeous, and in these days of professed æstheticism seem the right thing. Lilium candidum is just unfolding its snowy white blossoms, and though old and plentiful and common in cottage gardens, is still one of the best and purest of Lilies, as well as the most agreeably fragrant. The above named plants, though making a goodly list for June, are only a portion of what may now be seen in flower, as there are plenty of others of minor importance. J. S.

The Rosery.

THE ROSE HARVEST.—I hope "Wild Rose's" estimate of the Rose harvest is right; but present experience in the Eastern Counties by no means justifies his hopeful estimate. No doubt good Roses will be forthcoming at most of the ensuing Rose shows; they always are, no matter what the season. So many Roses are now grown specially for exhibition that the great shows seldom fail to be well furnished. At one of the first Rose shows of the season—that at Brantree on the 14th and 15th inst.—there were some fine Roses. The number of exhibitors was, however, very limited, and this is likely to be the case at all the early shows; but the scarcity of Roses in private gardens is somewhat extraordinary. In not a few hardly a perfect Rose has been cut till the middle of June. Fully half or three-fourths of what flowers have opened are quite deformed or lopsided, and the majority of buds show very little tendency to open. Before the rains the keen north-east winds held the buds fast in their shivering blasts, and with the rain came more cold and whipping winds, so that Rose prospects have not greatly brightened up till now (the evening of the 17th of June). I never remember seeing so few Roses, and so many imperfect flowers among the few so far. This paucity of Roses, with the loss of the major portion of our most useful fruit crops, is a heavy penalty to pay for summer in winter, and a killing dash of December in the tail of May and the head of June; for there really seems no other way of accounting for the poor estate of our fruits and Roses this midsummer. The brightest outlook among the Roses is the Briers, if it is not a bull to put it so. They look remarkably well, and the buds are likely to have a lively time of it so soon as the buds are sufficiently developed for the purpose. Possibly some general showers and warm weather may produce a good second bloom of Roses; late maidens may also yield some fine flowers, but the majority of cut-backs—as older plants are now characteristically, if somewhat technically called—are largely doomed so far as the first bloom is concerned. Maggots and aphid, as usual when anything is wrong either at top or bottom, have been abnormally numerous, strong, and active, and red-rust and mildew have likewise put in an appearance in several places; and altogether, what the Roses gained in safety or strength through the mildness of the winter they seem in a fair way of losing, or have already lost, through the coldness of the summer. D. T. Fish.

ROSE SHOWS.

We have been favoured by the Secretaries of the National Rose Society with the following list of

Rose Show Fixtures—	
June 27. * Maidstone	July 6. * Brockham
" 28. * Bath (National Rose Society)	" 6. * Eitham
" " * Grosvenor	" 7. * Hpswich
" " * Hitchin	" 8. * Sutton, Surrey
" 29. * Farningham	" 8. * Alexandra Palace
" " * Hereford	" 11. * West Kent
" * Norfolk & Norwich	" 11. * Christleton, Cheshire
" 33. * Horsham	" 12. * Cardiff
" * Masson House,	" 13. * Manchester
" * London.	" 15. * Manchester
" * Barnham	" 16. * Birkenhead
" 34. * Reigate	" 18. * Sutton
" * Crystal Palace	" 19. * Darlington (National Rose Society)
" 4. * South Kensington (National Rose Society)	" 19. * Darlington (National Rose Society)
" 6. * Canterbury	" 20. * Sutton Coldfield
" * Oxford	" 20. * Heleasburgh

Those marked with an * are affiliated to the National Rose Society; those with a † are not exclusively Rose societies.

Orchid Notes and Cleanings.

DENDROBIUM DALHOUSIANUM.—This fine old species is not often seen now in collections in the form of large well-flowered specimens. I purchased a small plant of it about six years ago, and divided it into two. They are now very handsome specimens, and one of them this season produced eighteen spikes of bloom, the other had as many, if not more. It is very easily grown; all that is required is a high temperature when the plants are making their growth; plenty of water at the roots and a moist atmosphere are also necessary. *J. D.*

ORCHIS INCARNATA.—With reference to a former paper of his given to the Linnean Society, Mr. C. B. Clarke at the last meeting drew the attention of the Fellows to a large bundle of plants gathered that morning by him in Hampshire, wherein were distinguishable at a glance the *O. incarnata*, Linn., the *O. incarnata*, Syme, and the *O. maculata*, Linn.

Florists' Flowers.

THE GLADIOLUS.—It is now time that the beds should be mulched with decayed manure, and the ground should be kept moist with repeated waterings. The object we ought to have in view now is to push on the plants as rapidly as possible without their receiving any check to their growth; as the spikes appear they must be tied to stoutish sticks, else the plants will be blown over on their sides by the first gale. Every grower should also be a seedling raiser, and if there are only a few hundreds of seedlings raised each year it is best to sow the seeds early in April, in pots, and grow them on in pots for the first year. There is always a certain percentage of good varieties in a batch of seedlings, and the anticipation of waiting for them to flower is very pleasant. See that no caterpillars are lurking in the centre of the plants, ready to devour the incipient flower-stem. Syringe the plants in the evenings of hot days.

PINKS.—If the cuttings of the early flowering section were put in at the time advised, and treated according to instructions, they will now be, as ours are, good strong plants. They were now set in the cutting-pots some weeks ago, and were planted about 3 inches apart in boxes; about the middle of July they are planted 8 or 9 inches apart in good open soil, where they soon form good clumps, which will produce masses of bloom from March to the middle of June next season. Put in pipings of the florists' section on the first favourable opportunity—that is, in showery weather. They strike best in a shady place, in a little bottom-heat. About two or three barrow-loads of fresh stable-manure put into a two-light frame will give just a gentle bottom-heat, which will cause roots to form very speedily. The pipings may be put into boxes, or they may be struck in some fine soil placed over the manure in the frames.

RANUNCULUS.—One of the critical points in the culture of these is the taking up of the tubers; as soon as the stems decay it is best to lift them at once; but, as they do not decay all at once in the same bed, it may be necessary to go over them two, or perhaps three times. The reason of this is that the tubers will start into growth as soon as they get a shower of rain, or even, if they have no rain, if the ground is moist. The tubers shrivel very much indeed if they are left spread out on a shelf for a length of time. It is best to store them away when quite dry in rain sand.

TULIPS.—In less than a week the bulbs will be taken up, as they show by the leaves rapidly changing colour that the bulbs are very rapidly approaching the ripening stage. When the bulbs are taken up place each sort into a pot without removing the offsets, and place the pots in a room which is neither damp nor too dry; over-dryness, such as placing them in a blazing sun, is injurious to the bulbs. As soon as the beds are cleared we dig them up and plant with *Asters*. *J. Douglas.*

The Kitchen Garden.

SINCE my last Calendar was written we have experienced a change in the weather, the nature of which, notwithstanding its being more characteristic of the month of March than that of June, afforded a good opportunity for carrying out the directions given in our number for June 10 respecting the planting-out of Broccoli and other plants, inasmuch as the latter, owing to the condition of the weather and ground at the time of planting, experienced scarcely any check in the process of transplanting. This will be a good time to make another planting of the stronger plants of the respective kinds of Savoys, the distance between the plants each way being, as with kindred plants, determined by the respective varieties as well as by the nature of the soil, in poor land less space being required than in rich ground. Small kinds, like Tom Thumb and Early Ulm, may be planted, as stated in our last Calendar, in rows 15 inches apart and 12 inches from plant to plant in the row, while Drumhead should have a space of 2 feet between the plants each way. In taking up the plants care should be exercised in examining the roots, in order to ascertain whether they are clubbed or not, and all that show signs of that disease should be cast away. Continue to make successional plantings of Celery in trenches, as previously described, and see that the plants in every stage of growth have plenty of water at the roots; and do not trouble about earthing them up until they have attained to 12 or 15 inches in height, thereby not only economising labour in the operation, but also lessening the chances of the soil getting into the hearts, which is not infrequently the case when the plants are earthed-up when only 6 or 8 inches high, and the primary object—the branching of the head—is secured as fully and completely as by carrying out the operation at more frequent intervals.

TOMATOES OUT-OF-DOORS.—The chief points to be observed in Tomato culture, whether indoors or out, are to keep the shoots and leaves well stopped and thinned. If the plants are trained up the wall with one, two, or more stems, which should not be closer to each other than 10 or 12 inches, all side shoots should be pinched at the first joint, and kept persistently stopped afterwards, and the leading and secondary branches stopped above the fruit, and so soon as the latter have set, their size will be increased and the development hastened by the plants when necessary having copious supplies of liquid manure at the root.

GENERAL WORK.—Owing to the early and plentiful supply of Peas, the cutting of Asparagus will ere this have been discontinued. This, under any circumstances, should be done from the middle to the end of June, to enable the plants to make foliage, and consequently fresh roots, and thus acquire more vigour for the ensuing year. The only attention which the beds will require for the next few months is to keep them free from weeds, and seedling plants, which are now coming up in all directions, should also be pulled up forthwith, and other work of a routine character, including the thinning of late sowings of Turnips and Spinach, the supporting of Canadian French Beans with short sticks to keep the plants erect and the Beans free from damage, the destruction of weeds, &c., will also require attention at the hands of the kitchen gardener. *H. W. Ward, Longford Castle Gardens, Wilts.*

Peaches and Nectarines.

KEEP the foliage on trees from which the fruit has been gathered in a clean healthy condition, by continual syringing twice daily, and by giving copious supplies of water at the roots whenever they require it. To allow them to get dry at the roots, at this season is frequently the cause of buds dropping in the spring, or whenever the trees are started. Any wood not required for fruiting next season, or any spurs at the base of which there have been fruit, may now be taken out, to give all the light, sun and air possible to next year's bearing wood. Stop any gross leading shoots, and pinch in laterals to one eye to keep an equal flow of sap all over the trees. The third house will now be swelling off its fruit, which expose by the means already mentioned to all the light and sun it is possible to give them, with a free circulation of air. Succession houses bring on according to the time they are required; any forcing is best done by sun-heat when possible, by shutting up early and keeping a moist genial atmosphere. Trees in late houses may now be finally thinned, leaving sufficient to allow of a few drooping during the stoning period. *J. Wallis, Kettle Gardens, June 20.*

Grapes and Vineries.

MADRESFIELD COURT GRAPE.—A few evenings since, in looking through the well kept gardens of Sir F. H. Bathurst, at Clarendon Park, Salisbury, I was pleased to see a couple of Vines of this handsome and excellent Grape in a flourishing condition in a Hamburgh-house—the bunches, like those of the Black Hamburgh, being large and well shaped, the berries, even for this variety, large, and taking on a beautiful bloom, and perfectly free from cracking—a tendency to which this handsome and highly flavoured Grape is subject, and in the present case, in the opinion of Mr. C. Warden and of the writer, the exemption from cracking is to be attributed to the fact of the laterals being allowed to make plenty of growth in front of the bunches, thereby drawing the superabundance of sap away from the berries, which are rather thin-skinned, and thus preventing them from cracking. Those of your readers who may hitherto have failed to grow this fine Grape satisfactorily should make a note of this, and apply the remedy forthwith, if not too late; for it is when the berries have obtained their full dimensions and are commencing to colour that they are most liable to "crack." I may remark, in conclusion, that Mr. Warden grows all his Vines in this house on the "long rod" system and in an outside border—that is, allowing young rods to run up from the main stems, which are of good thickness, last year to fruit this: cutting out the ones that fruited last year at pruning time, and so on—each succeeding year cutting out the wood of the preceding year's growth. To this fact and good cultivation may be attributed the fine size and promising good finish of the branches. *H. B.*

Plants and their Culture.

STOVES.—Those possessing a nice young clean stock of Gardenias of the more free blooming kinds will do well to turn them out into a pit where there is a command of bottom-heat to help them on later in the season; a far better supply will thus be secured, and that oftentimes when plants in pots will not be yielding such good returns. Give them a good open soil with plenty of drainage, so that water can be liberally applied. Look after the stock of Genestas for next autumn's blooming; they will do well in a pit at this season of the year; plunged in a little heat they will thrive the better. Give all possible attention also to every kind of plant grown for winter display. Avoid overwatering and too much shade, the better to secure a stocky, sturdy growth, which means a more satisfactory return when looked for. This season's seedling Gloxinias that are growing freely may require a shift, any in 60's can be safely transferred to 40's, and will make a good succession to the older stock. *Torenia Fourcieri* is now a useful plant, and repays attention; occasional pinching will keep it more compact. When there is room in the propagating pit a batch of Croton cuttings will give useful stock for the autumn, and any of the bright coloured *Dracenas* may be struck off to get them established again before next fall.

GREENHOUSE.—*Kalosanthes* now showing flower should have all the light possible; they will, in fact, perfect their flowers and develop a more intense colour if fully exposed to the sunshine in the open air. This is, however, a rather risky process, as a sudden storm would mar their beauty. *Rochea falcata* should not be kept too dry now, or a weakly flower-spike may be the result. These plants are valuable, coming in at a handy time. *Staticee* in flower and advancing towards that stage must be watered rather more freely. See that they do not stand where they would receive the contents of a syringe or catch any drip, damp being prejudicial to their well-being. *Aphelaxis* and *Phenacomas* require the same caution exercised with them. *Indian Azaleas* that have completed their growth may be gradually hardened off and then stood out-of-doors in a light airy place. Previous to taking them out, however, see if any trips are lurking about, and, if necessary, give a good fumigation; three nights in succession will settle these troublesome customers. *Camelias* I find do better (when placed out-of-doors) if they can have a somewhat moist and shady position accorded to them, with occasional syringing in hot weather. Winter-flowering *Heaths* and *Epacris* are now with us in the open air, standing on a bed of coal-ashes. *James Hudson, Gunnersbury House.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, June 27	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.; Luncheon offered to the Foreign Guests, at 2 P.M. Pelargonium Society's Show. Maidstone Rose Show. National Rose Society's Show at Bath. Croydon Horticultural Society's Show. Lee and Earle's Horticultural Society's Show (two days).
WEDNESDAY, June 28	Hitchin Rose Show. Annual Festival of the Gardeners' Royal Benevolent Institution at the Albion, Aldersgate Street. Farnham Rose Show.
THURSDAY, June 29	Hertford Rose Show. Newich Rose Show. Rose Show at the Mansion House, E.C. Horslem Rose Show. Farnham Rose Show.
FRIDAY, June 30	Crystal Palace Rose Show. Regate Rose Show.
SATURDAY, July 1	

THE art of GRAPE GROWING, like that of winning a boat or other race, depends very much on the start and the finish—the latter being the more important. Unless, however, both are managed with skill, it matters comparatively little what is done between. The cultivator that forces his Vines to put out all their strength in the breaking, and compels them to make a series of spurts afterwards, seldom finishes well. "Slow and strong" is the motto for the start, and the finish should be like unto it, "Slow and sure." A good deal has recently been written on what has been very properly called express culture. There may be, probably is, scope enough for this in the middle period of Grape growing; but high rates of speed are dangerous alike at the start and the finish, and no doubt they are most dangerous at the finish.

It may be somewhat difficult to explain the reason, but experience proves beyond doubt that growth may be developed much more rapidly than it can be matured. The mere enlargement of the size of fruit is a far simpler matter, and makes fewer demands on the strength and resources of the Vine than the ripening of the berries or the maturation of the seeds of Grapes. The latter process is by far the more complex, and for that reason probably the more exhausting. Green Grapes exhaust the Vines but little, but no sooner do they begin to ripen than comes the tug of war, and the strain on the developing power and feeding resources of the Vine.

Hence the necessity for slackening speed, as well as for increasing the resources of the Vine, and enabling it to make a better use of those provided. How far the slower rate of growth contributes to the latter two may be uncertain, but that the three together are essential to a high or perfect finish is generally agreed among Grape growers.

The common recipe for colouring, that is, perfectly ripening Grapes—a free circulation of air night and day—is probably as powerful in heightening and perfecting maturity, by lowering the temperature of the air, as in keeping it in perpetual motion. If this be so, it simplifies a phase of practice which has hitherto been somewhat difficult to explain; for, provided the Vines absorbed all they needed from air at rest it is by no means obvious why such air should not ripen Grapes as thoroughly as air in motion; out every one is conversant with the cooling effects of thorough draughts, and it is such that seem most important in the ripening of Grapes.

The value of a depression of temperature is further illustrated by the fact that air at night is needed for the maturation of Grapes. No matter how much air they may have in the day it is difficult, if not impossible, to finish Grapes well without a free circulation of air during the night. This not only lowers the temperature, but causes a greater disparity between the day and night temperatures than could otherwise be obtained, and there can be little doubt that this disparity is one of Nature's most powerful means of completing maturity. It corresponds with the fierceness of continual

sunshine and the coldness of its dews and hoar-frosts, and it may be somewhat difficult to say which of the two are the more powerful in producing complete ripeness. Perfect maturity is probably largely the result—the product of the two extremes of temperature. Hence, some of the best Grape growers give almost more air at night than by day. They husband the sun's rays to quicken the juices of the Grapes into full activity, and by lowering the temperature allow this to sink into comparative quiescence and repose during the night. The very suddenness, as well as the extent of the change of temperature, possibly hastens as well as heightens the completeness of the change of the acids and other substances into sugar, the product of such changes being a characteristic of maturity. But during all these changes the strain on the plant is incessant, and, as already hinted, chemical changes seem to exhaust the plant more than the mere physical enlargement of the fruit. Hence the necessity of a full larder during the last or finishing stage. The roots must be well supplied with food if the fruit is to be made quite perfect. It is quite a mistake to suppose that the finishing of Grapes is the work of the sun and air chiefly or only.

It is impossible to exaggerate the importance of light and air, and the powerful influence they exert in maturing Grapes. But root absorption or a full supply of suitable food though them, is of equal or more importance. As a matter of fact and experience, it is found that rich liquid and solid dressings are never so useful as during the colouring of Grapes. When the drainage mania was at its height, not a few crops of Grapes were crippled and ruined by the withholding of food and water from them so soon as they began to colour. This ended in disaster. Not a few of the most successful Grape growers now water and feed the roots till the Grapes are absolutely ripe.

But all this may not result in a perfect finish if there are more bunches than the roots can feed fully and well. This is very often the case. There are more crops of Grapes wrecked by overcropping than from all other evils put together. The roots on the Vine are numerous and strong enough to land twelve bunches at the goal of perfection, and it is made to carry twenty-four. The result is obvious—the entire crop is injured, probably three-fourths of it lost within sight almost of maturity. It is in this strongly adjusting the burden of Grapes to the strength of the Vine that the skill of the best Grape grower shines forth most conspicuously. A sufficiency of food and a moderate crop are two of the surest recipes for a perfect finish.

But one thing more at least is needed—that is, sufficient motive forces in the Vine itself. Broadly stated, the motive power, drawing or driving force, is as the area, size, and strength of its leaves. Nor is it in the finishing of its fruit that the strain upon these is greatest. During the early stages of growth leaves are so quickly produced and reproduced that the injury or removal of a few affects the Vine but little. Even green Grapes probably perform the functions of leaves to some extent, and may almost take care of themselves. It is, however, far otherwise as the Vines approach maturity or the finish. Each leaf then is in full collar, doing a threefold work—directly or indirectly sustaining itself, feeding or finishing the bunch, and filling up the bud at its base, or, in other words, manufacturing the embryo bunch for the following year. For the fulfilment of these purposes, and also to enable it to contribute its individual share to the general strength of the Vine and its roots, it must be freely and fully exposed to light and air, and have a genial atmosphere to live in. The latter is specially important. It is no uncommon thing to find the atmosphere of vineries so arid as to render the leaves crisp as scorched paper; they are, in

fact, scorched, and dry up or die off prematurely. As long, however, as there is any life in a Vine, it is probably contributing something—it may be a great deal—to the finishing of the fruit; it ought not, therefore, to be removed on any account; but the great thing is, to prevent the leaves getting into a crippled state. With a fair crop, and the tops and bottoms of the Vines carefully cultured, the leaves will remain more or less fresh till the fruit is ripe, even afterwards.

Next to the preservation of the leaves, fresh to the last is that of preserving as many as room can be found for. Some Grape growers sacrifice the leaves to give more light and air to the Grapes. This is generally a mistake: Grapes are not directly coloured thus, but indirectly through the ministry of the leaves. Whilst there ought to be no overcrowding of foliage, the greater part of the area of the house should be fully furnished with leaves. The Grapes of the densest black and the heaviest bloom, the Muscats of the deepest golden tints, will mostly be found under or among the finest canopy of foliage. These leaves, in fact, are the colour manufacturers as well as the active artists that lay it on, the Grapes themselves being more passive than active agents in the matter. It follows that the more colour factories or painters—in other words the more leaves—with room to work, and favourable conditions to work in, the better and more perfectly the Grape will be finished, and experience proves that this is so.

One word by way of warning, in conclusion. Perfectly finished Grapes are wanted, not once, but many times—that is, annually. To ensure this in succession with certainty it is needful to understand and practise the theory of the conservation of energy in such a way that the Vines shall be the stronger, not the weaker, for each crop of fruit they finish. Shoot, stem, branches, leaves, should not only be equal to the crop required of them, but more than equal to it, so that the residue of vital power not expended in finishing off the fruit may be safely and surely deposited in the Vine, to strengthen it against the contingencies or demands of any or all coming years.

— THE BELGIAN VISITORS.—A party of about eighteen Belgian horticulturists propose visiting this country next week for the purpose of seeing illustrations of various departments of British horticulture. The scheme proposed to meet the expressed wishes of the excursionists is as follows:—

MONDAY, June 26.—Visit to market florists' establishments and Kenitish fruit growers.

TUESDAY, June 27.—Exhibition of the Pelargonium Society at South Kensington. Luncheon offered by the Council of the Royal Horticultural Society and the Committee of the Pelargonium Society to the foreign visitors. Other gentlemen desirous of being present are requested to apply immediately to Mr. SHIRLEY HIBBERD, 15, Brownlow Park, Stoke Newington, or to Dr. MASTERS, Mount Avenue, Ealing. Tickets, 21s. each.

WEDNESDAY, June 28.—Visit to Slough, Frogmore, Clivedon, Dropmore, and Burnham Beeches.

THURSDAY, June 29.—Visit to market gardens in the neighbourhood of London. Dinner of the Gardeners' Benevolent Institution.

FRIDAY, June 30.—Visits to nursery establishments, at the discretion of the visitors.

SATURDAY, July 1.—Visit to Kew, Siou, and Chiswick.

In addition to these proposals, various offers of assistance and private hospitality on the part of nurserymen and others have been made to the Belgian visitors, whose headquarters will be at De Keyser's Royal Hotel, Blackfriars.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We venture again to remind our readers that the annual festival of this Institution will be held on Thursday evening next at the Albion, Aldersgate Street, under the Presidency of the Right Hon. the Lord Mayor, Sir J. WHITAKER ELLIS, supported by the Sheriffs of London and Middlesex, and others interested in the Institution. Knowing those of whom the Board of Stewards is composed,

and the excellence of the cause they plead, we have the best of reasons for believing that no stone has been left by them unturned to insure success, and it remains now for the rank and file of gardening—those of them who have the power and the will to do so—to do their part by contributing, with the sanction of their employers, what fruit or cut flowers they can spare, the former for the dessert, the latter to decorate the tables, and thus relieve the finances of the Society of one burden. On this occasion there will be present many supporters of the institution of high standing in the horticultural world, as well as a party of distinguished Belgian and French horticulturists who, next week, will be on a visit to this country, and it is in the highest degree desirable that there should not be a mean show of the results of English gardening skill on this occasion. We need only add that the Secretary, Mr. E. K. CUTLER,

Linnean Society on June 15. The minuteness of its flowers, scarcely $\frac{1}{8}$ inch in length with ovules $\frac{1}{30}$ inch in diameter, is most extraordinary; the more so, that the latter organs are succeeded by fruits of immensely large dimensions for the order. The plant has nearest affinity with *Alstonia*, from which it differs conspicuously in the sessile stigmas, and in the singular pistil.

— THE ORCHID EXHIBITIONS.—For the last two or three years it has become the custom with some of our leading nurserymen to establish during the London season a special exhibition of Orchids and other plants in their own establishments, and to specially invite those likely to be interested to come and see the display. This is a purely commercial speculation on the part of the exhibitors, of the advantages of which they must be the best judges and concerning

plants, distributed throughout his nursery, than to any special aggregation in one house. Here are the heroes of a hundred fights, and it is open to question whether they were not more imposing when seen in competition, or rather while surpassing other exhibits, of a similar kind at the various public exhibitions, than they are at home, surrounded by their equals, or by others little less remarkable. Our illustration shows one end of Mr. BULL'S house crowded with beautiful specimens, which have been mentioned from time to time in our columns. Certainly no visitor to London interested in Orchids should omit to visit the collections at Messrs. LOW'S, VEITCH'S, HENDERSON'S, WILLIAMS' and BULL'S.

— INDIA-RUBBER PLANTS.—Mr. W. T. THURLETON DYER, C.M.G., laid before the Linnean So-

FIG. 127.—MR. BULL'S SHOWHOUSE OF ORCHIDS,

14, Tavistock Row, Covent Garden, W.C., will be happy to give any information as to how and when such welcome contributions should be sent.

— GROUPS OF PÆONIES.—A very choice display of these charming flowers may now be seen at Eastleigh, near Teignmouth, South Devon, in the garden of Captain PAUL, where everything that is new and good finds its way, and is cherished and cared for by its owner. The group referred to consists of a dozen plants in good health of different sorts—white, crimson, and red, and others of a violet hue, changing to pink, the whole producing an effect superior to anything else in a garden where all kinds of plants are cultivated under the most favourable conditions of soil, climate, and attention.

— DYERA is the name of a new genus of rubber-producing plants belonging to the natural order Apocynaceæ, from the Malay Archipelago, and which was described by Sir J. D. HOOKER, at the

which no outsider has any right to express an opinion. But, as to the magnificence of the display made, there cannot be two opinions. A visit to Mr. BULL'S Orchid-houses at any time is a delight, but when the flowering plants are massed in large numbers, as they have been lately, the effect is certainly dazzling. In the case of the exhibition at Mr. BULL'S the effect is produced by large numbers of relatively small specimens, including some of the finest varieties in full bloom, intermixed with Ferns, Aroids, Palms, and fine-foliage plants. As a spectacle the flowering plants are too numerous and too crowded; but this of course is not the view that would be taken by the commercial horticulturist, or the purchaser, who would be impressed rather by the large amount of capital represented, and the grandeur of the display and potentiality of wealth which the plants suggest, than by mere artistic effect. But in any case the impression produced is so great that criticism is for the time banished. Mr. WILLIAMS trusts rather to his magnificent specimen

ciety on June 15 an important communication "On the Caoutchouc-yielding Apocynaceæ of Malaya and Tropical Africa." After giving a general sketch of the structure and physiological conditions of the occurrence of caoutchouc in plants, the author pointed out that the plants which appeared to yield it in commercial quantity in three widely separated regions, all belonged to one tribe of Apocynaceæ—the *Cariseæ*. In the East Indies, the *Gutta Singarib* of the Malay Peninsula, the *Gutta Sooloo* of Borneo, was the produce of a new species of *Willughbeia*, *W. Burtidgei*. Many other species of this and other allied genera also seemed to produce caoutchouc in quantity worth collecting. In Central Africa, *Landolphia*, which was closely allied to *Willughbeia*, but differed in possessing terminal instead of axillary flowers, was the most important source. On the East Coast caoutchouc was yielded by *L. ovariensis* and *L. florida*, the latter a very ornamental plant. As the rubber exuded from the cut stems it was plastered on the breast and arms, and

the thick layer, when peeled off and cut into squares, was called "Thimble rubber." On the West Coast the most important species was *L. Kiriki*, the rubber of which could be wound off into balls or small rolls from the cut stems like silk from a cocoon; this species was called "Materé." *L. florida* also occurred, and was called "M'bungu;" its rubber was worked up into balls, but was inferior in value. The rubber of *L. Petersiana* was of little importance. In South America, *Hancornia speciosa* yielded what was called "Mangabeira" rubber.

— ROSE MABEL MORRISON. — It has been charged against this beautiful white Rose that it is wanting in petal, and not so full as is desirable in a perfect flower, but we have seen some blooms lately, grown by Mr. BENNETT, against which the charge above-mentioned could not honestly be made. How Mr. BENNETT gets them to bloom in this desirable manner may be mentioned as a hint to other growers. He allows his plants to bloom from the terminal branches of the old wood, and the blossoms so produced nearly all come very full, and sometimes more so than Baroness Rothschild.

— GRAPE-GROWING ON THE ROOFS OF HOUSES. — That the most is not made of our garden resources becomes more obvious every day by experience, but it certainly is rather a novel, if not ingenious, method of Grape-growing to train the Vines over the roof of a house. At Lord HALDON'S, about four miles from Exeter, there is a good example of the system carried out upon the roof of the gardener's cottage, which is done in the following way:—The Vines are planted against wooden columns supporting a verandah in front of the cottage, and after travelling over the top of the verandah ascend to that of the cottage, upon which there is a wire trellis laid for training the Vines. The trellis-work is about a foot above the slates. The roof has a steep pitch, and in favourable seasons the Vines are said to succeed quite as well as if trained in the usual way against the garden wall. In Sussex it is nothing unusual to see Vines trained, or rather creeping, over the roof of an unsightly house or shed, but the trellis-work is seldom, if ever, seen. The idea is a good one for amateurs, and others, occupying houses in rural districts, which may not only be covered with rich foliage in summer, but also supply a few Grapes in ordinary seasons that will be all the more acceptable as to their production costing nothing more than a few pence to buy one or two Vines at the beginning. The trellis need not necessarily be of wire unless it is so desired by those adopting the system.

— THE EXETER NURSERY. — On Saturday evening last between forty and fifty of Messrs. LUCOMBE, PINCE & Co.'s employes met together at the Plymouth Inn, Exeter, and enjoyed the annual dinner, given as usual by the proprietor of the Exeter Nursery, Dr. WOODMAN. The proceedings were of a highly satisfactory character.

— STRAWBERRY MARGUERITE. — This Strawberry is largely grown in the South of England as a late cropper, and a very good one it is in dry seasons, but should the season turn out to be a wet one it is only third-rate in flavour, and is easily spoiled by heavy rains. It is the custom to plant late Strawberries in situations which are not favourable to the development of high flavour, or even appearance; and this is, of course, very well so far, for a chance late crop. But a better way would be to make two small plantings, one in an early situation, and a second upon a north or west border to come in for succession. In a private garden the great enjoyment is to have one crop coming in to succeed another in regular order, rather than to have a glut of fruit at any one time, and appearance and flavour are always welcome in desert fruits. In order, therefore, to secure these two essential points good runners should be obtained at once, or layered into small pots if there are old plants in stock, and when rooted planted out upon a "steep" south border. Mutch the ground between the plants after planting. The variety is rather a strong grower, and the plants should be planted at from 18 inches to 2 feet apart from plant to plant, and the same distance between the rows. From the nature and habit of the variety it requires a longer season of growth than dwarfier-growing kinds, and should therefore be planted out early in August at the latest, with a view of having the crowns well ripened

before the winter. This being done success will be sure to follow. The fruits will come much firmer in a high dry situation, and their flavour and appearance will be so much improved as to render them hardly recognizable with those grown under a less careful system of cultivation.

— THE WOLVERHAMPTON PUBLIC PARK has recently been greatly improved by the addition of a hand stand, presented to the town by the Right Hon. C. P. VILLIERS, M.P. This structure occupies a position on an elevated part of the park, from whence are obtainable the best views of the surrounding scenery, embracing the wooded Tottenhall ridge, and also of the park itself. Round the base of the stand is a grass border some 9 feet wide, relieved with ornamental beds planted with trees and flowers, and enclosed by a neat ring fence of wire. Outside this is a circular gravelled walk 30 feet in width, with five other walks, each 20 feet wide, radiating therefrom to the main roads in the park. The turf has been taken up and relaid upon improved levels to correspond with the walks. The canopy, like the stand, is of cast-iron, and octagonal in plan. It is dome-shaped in elevation, the profile or outline being to the curve known as the ogee. An ornamental railing, 3 feet 9 inches high, fixed to each of the columns, encloses the structure, and on one side a double-leaved gate is hung to plain wrought-iron standards. The total height to the top of the vane is about 35 feet, the diameter over the pillars being 20 feet, and over the eaves 28 feet. Partaking somewhat of the Italian style, this new addition to park adornment and town property has a very pleasing appearance, which is much aided by artistic decorative painting and gilding. Messrs. STEVEN BROS. & Co., of Upper Thames Street, London, E.C., and Glasgow, were the manufacturers of the ironwork.

— A SPRING FLOWER BED. — It is an admitted fact that spring bedding, well done, is sweeter to the eye than any style of summer bedding yet invented. Nor, indeed, is it to be wondered at that this should be so. We pass through a long dull period where there is little out-of-doors in the floral way of an inviting character. For some cause or other the unexplaining, flowering shrubs are not arranged as they might be, in order to give effect; in many cases the bed of them are not planted at all. It is not, therefore, surprising that the first masses of spring flowers are more welcome than those that succeed them in summer. At Haldon House, near Exeter, there are two serpent-like beds of *Silene pendula* compacta, edged with a band of *Salvia argentea* which in point of effect can hardly be exceeded. There is an indescribable sweetness about the little pink *Silene* in almost any position, but planted against the white satin-like leaves of *Salvia argentea* it is incomparably beautiful. The *Silene* will be succeeded by *Perilla*, which is already planted, so that both a spring and summer effect is secured at a very trifling cost.

— NEW METHOD OF GROWING AND TRAINING TOMATOS. — As we grow older the majority of us are supposed to grow wiser in our generation, and if we do not we certainly ought to do. At all events, in the matter of Tomato growing we have not been over-sharp in discovering the shortest way of obtaining the best results. As long as Tomato growing was carried on chiefly by private gardeners the one-leader system, which gave a few fine fruits, was all very well for the exhibition table, and ornamental-looking in the hothouse of a private gentleman; but as the public demand for English-grown Tomatos increases, the one-leader system will have to be given up, and the side-shoots more depended upon for a general crop. As a matter of fact the side-shoots are the most prolific, and if they do not bear the largest fruit, they produce the greatest quantity, and already the market growers, or the most knowing of them, are finding this out, and are very wisely altering their tactics. In the case of one—a well-known private gardener at one time—the system now adopted is to plant out in a narrow border (there are Cucumbers grown at the front of the same house), and peg down the side-shoots upon the surface of the border, where they root in a short time, and have to be supported under the weight of their crops. Instead, therefore, of having long naked stems, we shall in future have a border covered with medium-sized shoots, and laden

with fruits which pay as well, or better, than anything else in the market at the present day. Given a moderate-sized variety, and a free cropper, grown upon the principle indicated, and started early in the season, or even now, for a late crop, no other garden produce will be found to pay its way better, or be more generally satisfactory.

— HORSE-TAILS. — Representatives of the marsh vegetation of the ancient coal period would appear still to exist in South America; at least, specimens of *Equisetum giganteum* from Brazil, which is said to have aerial stems of 30 feet, were exhibited by Mr. W. T. THIBELTON DYER at the Linnean meeting on June 15. A forest of these would certainly carry the mind back to the time when our now coal beds were luxuriantly flourishing in the marshes of the period.

— PORTUGAL LAURELS IN DEVONSHIRE. — These are now extremely beautiful along the South Devon Coast, their leaves being almost hidden again by a profusion of their milky-white flowers. In the greater number of medium-sized gardens they are planted as "breaks," or protective boundary lines, or arches are formed of them over woodland walks, where perhaps they look most natural and beautiful. Those who like formal-trimmed shrubs will find in the Portugal Laurel a very striking object in pleasure-grounds during the flowering period, their cone-shaped flower-stems of unequal lengths presenting a surface of singular beauty and gracefulness; but, after all, it is the irregular form and natural growth that is most striking, and most agreeable to the eye, during the flowering season. The leaves, too, have a peculiar glossy greenness in the genial climate of Devonshire.

— PUBLICATIONS RECEIVED. — *Anales de la Sociedad Rural Argentina, revista mensual de ganaderia y agricultura Buenos Aires.* — *La Vigne Americaine.* — *Bulletin d'Arboriculture—Hamburger Garten und Blumen Zeitung.* — *Greentice.* — *British Fresh-water Algae*: part 2. By M. C. COOKE (WILLIAMS & NORGADE). — *Proceedings of the Agricultural Society of Madras.* — *Hot-water Heating.* By F. A. FAWKES (BATSFORD). — *The Forester.* By JAMES BROWN. Fifth edition, enlarged and improved (BLACKWOOD & SONS).

— THE WEATHER. — General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending June 19, issued by the Meteorological Office, London:—The weather has again been cold, showery, and extremely unseasonable, in all parts of the kingdom. Thunder and lightning have been experienced in several parts of England. The temperature has again been below the mean in all districts, the deficit being 5° or 6° over the greater part of England, and 4° or 5° in Ireland and Scotland. In very many places the maxima did not exceed 65° during the whole period, while the minima, which was registered on the 16th in Ireland and the 17th over England, were as low as 33° in "Ireland, N.," 35° over central England, and from 36° to 38° elsewhere. On the grass temperature was, of course, much lower, and in London during the early morning of the 16th it fell to 31°. Rainfall has been a little less than the mean in the "Midland Counties" and "England, N.E.," but more elsewhere; at the north-western stations and in "England, E." the excess was considerable. Bright sunshine shows a decrease in duration in most districts, the percentages ranging from 20 in "Ireland, N.," to 46 in "England, S.W." Depressions observed:—The barometer has been generally higher over France and our southern coasts, while numerous depressions have passed from west to east across our more northern districts. The wind has consequently varied between south and west or north-west, and, though generally light or moderate, blew with the force of a strong breeze or fresh gale at many of the northern stations from the 13th to the 15th.

— GARDENING APPOINTMENTS. — Mr. GEORGE URQUHART, one of the young gardeners in the Royal Botanic Garden of Edinburgh, has, on the recommendation of Mr. SADLER, the Curator, been appointed by the Secretary of State for India, Assistant Curator of the Royal Botanic Gardens at Howrah, Calcutta. — Mr. A. PARROTT, Foreman to Mr. HARE, at Wellington, Grantham, has been engaged as Gardener to T. A. SCANNELL, Esq., Marlands Park, Farnham, Surrey. — Mr. Wm. MILNE, Foreman to Mr. SUTTON, Workshop Manor, Notts, has been engaged as Gardener to Mrs. VIVAR, Stibington Hall, Wansford, Northamptonshire.

HOME CORRESPONDENCE.

The Electric Light.—In referring in your issue of the 10th inst. to the experiments upon which I have been engaged for the last three winters at Sherwood, Tunbridge Wells, for the purpose of determining the influence of electric light upon the development of plants, you remark very properly that show results should not be aimed at until after certain principles involved are clearly established. In carrying on these investigations the results are often negative and disappointing for the moment, but are on that account perhaps the more instructive. I do not, therefore, wonder that your contemporary's correspondent who visited Sherwood in my absence was not favourably impressed, and I should add that I am only proposing to myself the development of certain physical problems involved. One interesting fact results from last winter's campaign. Having sown two small pieces of ground at about the same time with Wheat, Oats, Barley, Rape, and other annuals, I found that the action of the electric light, which was allowed to play upon one field, was very remarkable during the early period of growth. Although during the winter time the observable progress was retarded, on the first appearance of mild weather in January the plants in the electric field took a start, so that some of the Wheat taken up on May 31 stood 4 feet 6 inches high, was in vigorous growth, and had fully developed ears in full bloom, whilst that in the general field was only 2 feet in average height, without any development of the ear; the soil was very similar in both cases, whilst the field not influenced by the electric light had decidedly the advantage as regards exposure to the sun. The plants taken up from these two fields have been dried and put into a case, thus furnishing a convenient record of the efficacy of the electric light in the early stages of growth. [May we suggest that a chemical analysis be made of these specimens?] I notice that the experiments made last summer at the Paris Exhibition have been frequently referred to as showing that the electric light, though efficacious in the manner described in my papers, produced but very small effects. But it should be borne in mind that in those experiments could be of no scientific or practical value, having been got up only for a show inside a building abounding with gas lights, gas engines, and gas producers. The two arc lights employed had a power probably not exceeding 200 candles each, were at first installed unprotected by glass, which is so necessary to intercept the ultra violet rays, and were without the means of discharging the harmful nitrous compounds developed in the arc; the wonder in my mind was that under these untoward circumstances the plants could be made to survive at all. C. H. Siemens, 12, Queen Anne's Gate, S.W., June 20. [Botanists and horticulturists cannot sufficiently express their obligations to Dr. Siemens for his endeavours to solve a problem of the highest scientific interest, and the practical results of which may be in the future of the utmost importance. ED.]

The Potato Disease.—This unwelcome visitor has already put in an appearance in this district, and at the time of writing (June 17) has almost completely destroyed the haulm on some patches of early sorts, and a few spots are to be found on the second earlies. This is about a fortnight earlier than it has been observed in this district in past seasons. I have observed that the disease almost invariably commences its ravages in those potato beds which are, to a certain extent, shaded by trees, and I find that this season is no exception to the rule, as the first lot I saw attacked was in a cottage garden, very heavily shaded by timber, as most of the cottage gardens in this county are, and they are, so to speak, hotbeds for the disease, from whence the spores are dispersed in every direction. Potatoes, generally, and early varieties especially, must be nearly fully grown before the disease will attack them virulently, and where cottagers in particular often leave their crop in the disease commencing in the early one, and spreading at once to the late sorts, planted by the side of them. They would to a great extent save their crops if they could only be induced to remove the haulm of the early varieties, as soon as the first spots are observed, and destroy it. [We have often urged the necessity for this procedure. Those who take every precaution against the disease do not get all the reward they should, as long as their neighbours remain indifferent in the matter, as a garden wall will not keep the spores out. When the disease is not spreading rapidly and the tubers have not attained a fair size; it is a good plan to go through the rows and remove all the affected leaves. We saved a large patch of American and other varieties, which are generally so badly affected by the disease, in this manner last year. *Lombard.*]

In this locality the disease has already made its appearance in the haulm, and this, too, to rather an alarming degree. A plot of Myatt's Ashleaf,

which were attacked on the 11th inst., are now almost black and leafless, and this morning I have been informed by a neighbour that even his *Magnum Bonum* are beginning to show it as plain as a "spike staff." That the disease should make its appearance so soon—nearly a month earlier than heretofore—is a matter for much regret, and is anything but a hopeful sign for the year's crop. Should the present state of the weather—which is highly favourable to the development of the disease—continue for many days longer, it is certain to spread with great rapidity. J. Hornefield, *Heythorpe, June 19.* [We were sorry to observe the progress of the disease near Folkestone recently. ED.]

How to Make a Paper Box.—The invention shown in the annexed engravings (figs. 128, 129) is a new construction of a folding box, having its body and cover in one piece, so that it can be set up without paste or other adhesive material. The blank, of which the body portion of the box is formed, is cut so as to form the flaps, A, B, C, and the cover portion so as to form the flap, D, and the fastening flap. The blank is then scored in such a manner that corresponding

FIG. 128.—DIAGRAM SHOWING CONSTRUCTION OF BOX.

portions form the bottom and cover, and other corresponding rectangular portions form two sides of the box, the other two sides being closed by the folding in of the flaps of the main body of the box. The front side portion of the box has slots formed through it to receive the ends of the locking flaps. The flaps of the body and cover are perforated to receive a cord or tape to secure the box in a folded position. It will be seen that the box is cheaply made, easily set up, and occupies very small space for shipping or storing. *Scientific American.* [We may add to the above that, supposing a box is required 12 inches long, 8 wide, and 8 deep, the paper or card necessary for

FIG. 129.—BOX COMPLETED.

such a box must be of the shape and dimensions shown in the outline diagram. It is necessary that the holes should be in an exactly correct position, or the string will not pass them all. The hole of the flap should be 2 inches from the edge, and in the exact centre at this position; the hole at A and C should be 2 inches each way from the outside corners as shown, whilst the holes on flaps belonging to top of box E should be 2 inches from the line of fold and in the centre at this position. The diagram is drawn to scale, and if properly made, a very compact box will result, as in the lower illustration. Of course, when the dimensions are altered, boxes of any size can be made, either larger or smaller. ED.]

Strawberry Bothwell Bank Prolific.—"Herefordian," p. 815, asks some one to tell him the difference between the above and President. Eighteen months ago we had a dozen plants of the Bothwell variety from Edinburgh, and about this time last year a good many runners were detached and planted on a south border. Three weeks ago we had ripe fruit on these, and President, a few yards distant, is just now beginning to ripen. In this there is a wide difference between the two; the Bothwell Bank is also much more prolific, but in size of fruit and flavour it does resemble President. This latter does not do well, here and will be decreased or thrown away altogether, but we intend multiplying the other variety to

a considerable extent. J. Muir, *Margam Park, June 20.*

The Queen Onion.—I last summer read a notice in your paper recommending the Queen Onion as one of the best for autumn sowing for the spring crop, I therefore had a bed of it sown on July 26 last. I have now a most wonderful crop, quite ripe and ready for housing. The bulbs vary from 2 inches to 3 inches in diameter. The frost in winter lifted them slightly, so I had half an inch of sawdust sown on, and on the sawdust a dressing of soot. This put all right, and we had no further trouble. At the same time I had with the Queen a bed of the Italian Red also sown. These are the bulbs we do, but they are far behind the Queen; as the diameter do not measure more than 1 inch to 1 1/2 inches in diameter. But we are not in the tropics here; we are in North Derbyshire, 530 feet above sea level on the upper waters of the Derwent. *Cijolla.*

Vegetables: Edinburgh International Fruit Show.—Agreeing with the general remarks of Mr. Muir in reference to the managers of Horticultural Societies not offering prizes for new vegetables, as they do for fruits and plants, I am afraid it is now too late to expect a class for such at the International, the committee of management are quite right in giving little encouragement for the exhibition of vegetables as a whole. Edinburgh has never held out much inducement for the exhibition of vegetables at its ordinary shows, and the exhibits generally correspond with the prizes offered. It may be said that the luxurious few alone are interested in first-class fruit culture, but all, even the poorest of the poor, have a desire to obtain good vegetables, from the tiny Radish to the monster Cabbage, and I have often thought it a pity that more encouragement could not be given for the production of first-class vegetables as compared with fruits and plants. However, there is one thing the managers of the International ought to do, if not already done—to bestir themselves and try and obtain from the various railway companies every facility in the way of cheap fares for those who visit the show. To quote Dundee—they not only give for more encouragement at the ordinary shows for the exhibition of vegetables than the International offer, but they also arrange every season with the railway companies for cheap fares; hence, to a great extent, the number of visitors and the success of their shows is to be attributed, and it would be well for the International were the same privilege obtained for it. *James Brown, Abercainy, Perthshire.*

—Mr. Muir's wish that our large shows should be made to encourage the introduction of new vegetables is both natural and proper, but the phrase "any new kind of vegetable" would not only be a wide one, but not quite sufficiently explicit. If any new or novel vegetables of kinds not yet in commerce were asked for something new and novel might turn up, but if the result of the class as first put were but to bring together a score of seedling Peas, the same of Potatoes, and of other vegetables in proportion, the product would be chaos, and the awards valueless. If I do not assume that there are not be many meritorious seedling or new kinds of Peas, Potatoes, and similar things, but the difficulty which presents itself is, how are the judges to be assured that such kinds are both new and meritorious? The samples, as they lie on the tables before them, carry with them no evidence, and it would hardly be safe to accept the statement of partial and often enthusiastic, though possibly still truthful exhibitors. I think that executive committees of flower shows are well advised in offering prizes to keep well within the limits hitherto followed without striving after the illimitable. It is only this year, after much weary exhortation had been expended, that the committee of the International Potato show has been induced to adopt the needful precautions to ensure that its seedling Potato classes shall be filled by *bona fide* seedlings only. And it is only possible for a society having special objects in view to thoroughly deal with a matter of this special nature. The Potato society which Mr. Gilbert, of Burghley, is promoting is not prepared to test fully by growth and comparison all the assumed seedling kinds of Potatos put before it, it will but help to make confusion worse confounded. With our knowledge of so-called new Grapes even such a class as that to be found in the Edinburgh schedule can hardly have much value. The finest kind exhibited may after a few years' growth prove to be absolutely worthless. A.

Hydrangea Hortensia.—This is a very useful and showy plant for decorative purposes when grown in 4-inch pots, with single stems from 9 to 15 inches high and individual blooms or trusses as many inches through, and associated with small plants of scarlet flowering Begonias, double Petunias, pink and white; *Pelargonium*, *Salvia patens*, and *Fern* intermixed; the effect thus produced in the conservatories at Lockerly Hall and Clarendon Park at the present time is a pleasing one, the *corerulea*-tinted pink

flowers of the *Hydrangea* agreeably harmonising with the different shades of scarlet, pink, white, and blue, which, with the Ferns and flowering climbers depending in wild profusion from the roof, make a graceful finish and a pretty floral picture. As, perhaps, a few of your readers may not see their way clearly to achieving results such as above indicated, I may remark that the cuttings of *Hydrangea* should be taken off and struck soon after the flower-buds have been formed; that is, about the middle of September, or earlier according to the time the plants have completed their growth. The plants will succeed well if other cultural points are duly attended to in equal parts fibry peat and loam with a dash of rough sand added. *I. H. W.* [We lately saw some splendid specimens produced by similar means in Mr. Barron's nursery at Borrowash. The plants were remarkably vigorous, clean, and full of bloom—perfect specimens, in fact. *Ed.*]

Lychnis vespertina and *L. diurna*.—In the name of many gardeners who have found as much difficulty as I have in propagating the double white Campion I thank Mr. Jenkins for his note. It is a very fine garden plant, though this year, in common with many other plants, its leaves have the curly blight. In wet weather also it has the habit of shedding its flowers before or as soon as they are open. On looking again at my cuttings I find that one out of seven or eight is not so struck and filled the pot with roots; the others look as if put in yesterday, having been put in in February. As Mr. Jenkins says, there is considerable confusion about the red and the white Campion. I cannot say whether those botanists are right who look upon the larger white Chapon as a variety of the common Rose Campion, but to ordinary observation it is quite distinct in form and habit. *L. vespertina*, otherwise called *L. dioica alba*, is a large, straggling, long-jointed plant, inhabiting clover fields often in woods or banks. The flowers are white or sometimes pale rose, never dark rose or red. *L. diurna*, or *dioica rubra*, is common in every plantation and on every bank. The normal colour of the flower is dark rose, but it commonly varies through every shade of pink to pure white, though even in that colour the plant may be distinguished at a glance from *L. vespertina*. The double form, which is very common, increases at a more prodigious rate in any plant I know, and roots readily from every joint, whether detached or not. A double of the white variety would therefore be a great acquisition to gardens, and I wish I knew how to encourage flowers to become double from seed. The habit of this, as a garden plant, is very superior to *L. vespertina*. *C. Wolley Dod, Erskine House, Llundudno, June 17.*

I have for years past been in the habit of striking a few cuttings of *L. vespertina* fl. pl. also annually. I take off the cuttings just at this time, and plant them under a bell-glass. They are a long time in rooting, but some of them always do root. I have never seen *L. vespertina* with flowers as deep a shade of red as those of *L. diurna*, but a year or two since I found many plants in corn-fields with pale pink flowers near the village of Merton, Theford. If a double form of this pink variety could be produced it would be a great acquisition to our gardens. *H. Harpur-Cree, The Rectory, Drayton-Beachamp, Tring, June 19.*

Pot Marigold Meteor.—What a pity 'tis that this exquisitely marked flower is but a pot Marigold! The very prefix of "pot" is vulgar and repelling, it breathes of the scullery, of smut and dirt, of everything that is disagreeable and obnoxious, and thousands of lovers of flowers at once, on hearing of this Marigold, jump to the conclusion that anything so miserably named must be a coarse common plant indeed. And then whoever could have been so silly as to give it the distinctive appellation of Meteor? Should strangers to the flower accept this name as indicative of its fleeting properties, they would assume that it was but a floral flash in the pan—a momentary thing of beauty, existing only so as suddenly disappear. Some of our earlier poets, whose eyes could not have feasted upon the gorgeous Roses, Orchids, and other innumerable and resplendent garden flowers of our day, sang love songs to the yellow Marigold, and breathed over its winking golden buds an air of poetry such as should have saved a charming old flower from the detestable prefix of "pot." The greater scarcity of garden flowers in a few nations, since possibly weight for those more real love and veneration than we give to flowers now, for our great wealth of floral treasure has, perhaps, rather taught us to look contemptuously upon simple things, and to prize those that are rare rather because they are costly than because they are beautiful. But this humble, early, and, not least, hardy Marigold, finds, perhaps, more congenial homes in the gardens of the poor than in those of the wealthy. It is not that it is not pretty, and indeed, for supplying cut flowers, serviceable; but then it is so common, and, after all, is only a Marigold. But, contemptuous ones, let me say that

this Meteor variety, so exquisitely and perfectly striped in lemon and orange, and with flowers so double and of such good form, is not common, and still farther, wherever seen, always causes surprise and evokes admiration. As the open winter spared all my plants that bloomed so persistently all through last summer, and autumn, I have been enabled to realise that the greatest perfection in markings to be found in the second year's produce, and still more, that, strange yet true, the prints given of the flowers when first sent out were literally truthful and unexaggerated. *A. D.*

Epping Forest Club Underground.—On Saturday last this field club went to Hangman's Wood, one mile north of Little Thurrock, on the north side of the Thames, opposite Gravesend, to examine the "Den-holes." Hangman's Wood is a peculiar one; for although its area is not more than a quarter of a mile square, it is furnished with seventy-two "Den-holes." The majority of these are what is termed "filled up," but several are open. The "filled up" examples are about 20 feet in diameter, 6 or 8 feet deep, and present themselves as deep basins. At the bottom of some of these basins there is a hole like the orifice of a well, which goes deep into the earth. Such holes are hardly safe for children, insect-catchers, and British botanists, and at one time they were wired over; not, however, for the safety of human beings, but to prevent dogs and foxes falling down. The "filled up" examples are probably not entirely filled up from top to bottom, but roots and rainwash have gradually made a sort of make-shift natural plug, or cork. On Saturday last it was explained that a "filled up" hole had this year opened itself again by the plug of earth and leaves dropping to the bottom. Some of these plugged holes occur in the paths, so that it is at times advisable to walk carefully, or the pedestrian may run a chance of going to the bottom with the plug. The holes probably date from pre-historic (an elastic time) times. Similar holes occur in Kent, as near Blackheath and Dartford, at Stouffville, near Dromon; at Wrotham, near Worthing; at Spiennes, near Mons, in Belgium; and elsewhere. The rustics on the spot have strange ideas of the apartments below, and some archeologists have described these burrowings as habitations, or even places of worship, with altars. Sometimes rustics let each other down, after a primitive fashion, by means of a rope, but it requires a sailor, or a strong and skilful athlete, to perform this feat to perfection with such simple apparatus as a rope only. The writer of these lines has known these holes for many years, and hardly looking for flints and funguses has often cast a wistful eye down, and longed to descend. It was, therefore, with unusual pleasure that he received an invitation last week to be let down one or two of these wells, with other members of this club, in a comfortable way. Mr. George Biddell, of Grays, kindly gave permission for the exploration, and nobly furnished some wooden gibbet-looking apparatus, with ropes, windlass, and wheels, for the purpose.

Two holes were explored, and both were 82 feet deep. First the hole was made through 60 feet of loam and sand, and the rest through the solid chalk. A great deal of the chalk and sand of the first hole had fallen in, but the second was far more perfect. This at the base opened into several large lateral caverns. When the ground and new villas suddenly sink several feet in the earth, as at Blackheath and elsewhere, it is sometimes owing to the collapse of caverns of this nature. In some places the floor was visible. Many bones are in the caves, and a doctor who accompanied the party referred these bones to the rat, rabbit, dog, and fox. The rabbits had made burrows in the fallen sand, and the dogs had made deep striations with their claws at the base of the well in futile attempts to get out. The chalk is to this day as white as snow, and the innumerable marks of the metal picks of the excavators as sharp as if done but yesterday. The places were well illuminated with candles, and several feet as the writer's spiders were seen walking about, together with a *Helix*, evidently lost. A large number of sticks and stems were littered about the floors, and these supported a good crop of fungus life, both in the form of dense mycelium and the more perfect form of *Corticium*, and other *Fungi*. Many seeds that had dropped from the top to the bottom were growing in a blanché state below. The explorers, on going up and down, sat across a short transverse stick, and for the greater part of the journey turned round and round like a joint of meat on a roasting-gale. A lively discussion took place at the "King's Arms," Grays, as to the meaning and purpose of these holes, the writer maintaining that they were burrows for flints for the manufacture of flint implements in ancient times. One speaker considered them places of refuge in times of trouble (it would be a bad job if the enemy ran away with the rope); another that they were caverns for storing corn when it was not safe to leave it in the fields (a damp and mouldy storehouse at the best)—all in pre-historic times. Many artificial flakes of flint were met with, mostly outside

the holes. The best object was found by the writer, who lighted on a beautiful little flint knife, with secondary working on both sides. The trees in the wood showed signs of severe suffering from the late gale, except the Ash, which was in uncommonly good form—probably because it came into leaf after the gale. All the wild Mallows were badly down with the *Fucinia*. *H. G. S.*

Standard Laurels about Swansea—In many of the best gardens about Swansea, which have been laid out by Mr. William Barron, of Sketty, standard plants of the broad-leaved Laurel have been used with excellent effect along terraces and in combinations of shrubs. The stems are 3 or 4 feet in height, and surmounted with a finely shaped bushy branch of rich green leaves. They resemble orange trees more than anything I can think of, and may certainly be pressed as such at a little distance. They are favourite subjects with this landscape gardener, and it is surprising they are not more generally used throughout the country, for when the effect of them is once properly seen it will not readily be forgotten. *J. Muir, Margam Park, Talbach.*

Reports of Societies.

York Gala : June 14, 15, and 16.—The York show this year was not only such as to maintain the popularity it has long enjoyed, but also to still further enhance the reputation it has attained of bringing together one of the best displays of horticultural produce witnessed in the kingdom. Almost every section in the principal departments was thoroughly represented, and flowers were present in large quantities and in fine condition; fruit was nicely shown, and vegetables were very good. In the principal open class of sixteen plants, ten in *Zelma* and six fine-foliated, Mr. Letts, gr. to the Earl of Zetland, exhibited. *Marche-by-the-Sea*, was easily 1st, showing one of the best collections ever placed on an exhibition stage—not an inferior plant amongst them. His flowering examples were *Dracophyllum gracile*, 4½ feet through; *Phenocoma proflera*, similar in size; a huge *Stephanotis*, covered with flowers, and a *Williamsii*, bearing hundreds of heads of bloom; a grandly flowered *Heath*, *Allamanda grandiflora*, large and full of flower; *Anthurium Scherzerianum*, with fifty unusually big bouquets; *Statico profusa*, large and finely flowered; *Douglasvillea glabra*, so covered with its small well-quantified as to hide the leaves; and an immense bush of *Azalea Brilliant*; these were set in a framework of green and variegated-leaved plants comprising *Alnans*, Ferns, and *Crotons*—collectively a fine group. 2d, Messrs. Cole, Withington, Manchester, with silver good *Palms* and *Crotons*, *Thrinax*, *Heath*, and other flowering specimens. 3d, Mr. Berry, gr. to W. Dove, Esq., staging a nice lot. Six stove and greenhouse flowering plants.—Here also Mr. Letts took the lead, having a well bloomed half dozen, in which were *Isora ambonyensis*, an enormous *Clerodendron Scherzerianum*, and a *Williamsii*, bearing hundreds of flowers. Mr. Tudgey, gr. to T. F. G. Williams, Esq., Worcester, was 2d.

In the class for eight fine-leaved plants, there were a number of exhibitors, Mr. Letts again being well with the front row, amongst his competitors being Messrs. Vroomil, Croton Queen Victoria, and C. Johannsen, each 5 feet through, and finely colored; *Dion edule*, *Gleichenia Mendellii* and *G. rupestris*, dense green, vigorous bushes. Messrs. Cole, who were 2d, had a large and handsome lot, in which were three *Ferns*—*Lattina borbonica*, *Arcaea rubra*, and *Thrinax elegans*—and *Crotons Disraeli* and *Weissmanni*. Mr. Tudgey came in 3d with specimens smaller but of good quality. Mr. Noble and Mr. Lyon, gr. to Vicountess Ossington, Newark, received extra prizes.

Four ornamental plants.—Here, too, there were a number of competitors. Mr. McIntyre, gr. to Mrs. Pease, Warlington, taking 1st with a nice group. With eight exotic Ferns, Mr. Letts also scored first honours, showing, amongst a few looking lot, *Cibotium regale*, the rare *Sadleria cyatheoides*, with large masses of fronds, and a *Phlegmum*, bearing a fine lot of flowers, whose group contained several fresh *Gleichenias*, and various Tree Ferns; 3d, Mr. Bonsall, gr. to J. Rhodes, Esq., who in a nice collection had a grand *Todea superba*, 4 feet in diameter. *Hardy Ferns* are always present at the York shows, and this year were not an exception, forming in themselves a feature. The winning twelve (exhibitor's name not given) were a magnificent lot, including *Polypodium Stanfieldii*, *Blechnum spicatum ramosum*, *Adiantum pedatum*, and a new, unnamed, profusely crested *Scolopendrium*; Mr. Scott, gr. to W. Buckle, Esq., who took 2d, also had an excellent collection, containing *Osunda regalis cristata*, 4½ feet across; *Athyrium cristatum*, and *A. plumosum*, unusually fine. Mr. Rylance, Ormskirk, 3d, had a good group, but too many *Athyrium* amongst them.

Orchids were present in such numbers, so large and fine, that it is difficult to say which were the best seen at York. Mr. Hill, gr. to G. Hardy, Esq., Impberly, Manchester, took the lead with a grand half dozen, comprising *Odontoglossum vexillarium*, 2 feet in diameter, a mass of bloom; *Cattleya Mossiae*, equally large and full of flower; *G. Mendellii*, bearing 2½ spikes; the long *Anguloa Clowesii*, carrying some fifteen flowers; *Odontoglossum crispum*, a splendid variety with enor-

mous spikes; and Vanda suavis. Mr. Mitchell, gr. to Dr. Ainsworth, Broughton, Manchester, was a good 2d. showing large well-bloomed plants that would not have had to put up with 2d honours in many competitions, 3d. Mr. Hayward, gr. to Captain Hicks, Thurst, also a creditable exhibit; 4th, Mr. Bonsall, Three Orchids.—In this class Mr. Beddows, gr. to F. Perceval, had the first honours, with an immense *Odontoglossum vexillarium*, nearly a yard in diameter; *Cypripedium barbatum*, and *Cattleya Mossie*, a single piece bearing over forty flowers; this, we understand, was imported only about two years ago. We venture to hint that if big plants are raised in little time procuring large specimens, with its in every way preferable to crowding quantities of small ones together when in bloom. 2d, Mr. Hill, with *Cypripedium Lawrenceanum*, *Odontoglossum vexillarium*, and *Dendrobium Jamesianum*, thickly studded with its lovely white orange-centred flowers; Mr. Kollinson, gr. to W. Bateman, Esq., Harrogate, was 3d, and Mr. Mitchell 4th, both having meritorious plants. Single specimen Orchid.—1st, Mr. Beddows, a densely flowered *Cattleya Mossie*, over 2 feet across; 2d, Mr. Eastwood, gr. to F. W. Teley, Esq., Westwood, Leeds—*Aerides Fieldingii*, in unusually good condition, carrying three spikes branched from 2 to 2½ feet long; 3d, Mr. Hill, with *Vanda tricolor superba*.

There were two classes for groups of plants arranged in pots, which would grow together in the garden, the large one—200 square feet.—Mr. Simpson, Selby, had 1st, putting up a well arranged lot sufficiently relieved in the surface, and with an absence of the unsuitable trained examples sometimes shown in these exhibits; in 2d, Mr. G. G. Peaches, the competitors kept fairly clear of plants of this description. Mr. Berry was a good 2d, Mr. Bonsall 3d, and Mr. McIntyre 4th. In the smaller groups, which were also well done, the prizes went to Messrs. Scott, Noble, and McIntosh, in the order of their names.

Pelargonium.—Invariably well shown, in size and condition that reminds us of the days of Bailey, Turner, and Ward. With twelve show varieties Messrs. Lazenby were to the fore, putting up a good exhibit, the most effective of which were *Duchess of Edinburgh*, *Queen Bess*, *Triomphe de St. Mandé*, *Exhibitor*, and *Rebecca*; 2d, Mr. G. G. Peaches, with *Queen Bess*, *Exhibitor*, and *Rebecca*; 3d, Mr. G. G. Peaches, with *Queen Bess*, *Exhibitor*, and *Rebecca*; 4th, Mr. G. G. Peaches, with *Queen Bess*, *Exhibitor*, and *Rebecca*. For twelve, Messrs. Pybus & Son, Ripon, took the lead with a collection alike good in flower and foliage, among which Mrs. Chandler, Mrs. W. Paul, Polly King, and Warrior, were the brightest; 2d, Mr. Eastwood, who in a well-bloomed lot had *Flourence Durand*, *Princess of Wales*, *Leonides*, and *Wellington*; 3d, Mr. McIntosh. For six zonals Mr. Winterbone took the lead with a well done half-dozen, in which *La Dame Blanche* and *Flourence Durand* were the best. The fancy varieties, now so little grown, but so well represented in their class, were of delicate colours, were well represented by Mr. Kylan's winning six—new varieties of this class of *Pelargonium*, good enough to beat the old ones, only make their appearance at rare intervals; the best were *Sarah Turner*, *Queen Antislavia*, *Her Majesty*, and *Princess Victoria*; 2d, Mr. May. *Fuchsias* were better done than we usually see them at the Southern exhibitions; they consisted mostly of established well-proved kinds. With six Mr. Clarke, gr. to Miss Wharton, York, had 1st, and *Roses*, not less than a fine variety, among which Mr. E. R. Whitwell, Darlington, who took 1st, had nice blooms of *Belle Lyonaise*, *Souvenir d'Elise*, *Vardone*, *Marchal Niel*, *Madame H. Jamin*, and *Soubreuil*; 2d, Mr. O'Neary, gr. to Mrs. Grimston.

At stove and greenhouse flowers were forthcoming in quantity, and in the best condition. With twelve, Mr. McIndoe, gr. to Sir J. Pense, Guisborough, came in 1st, putting up a splendid lot, containing *Odontoglossum Roezlii*, *Phalaenopsis grandiflora*, *Anturium Andreanum*, *Ixoras*, and others of similar description; Messrs. Cole was a close 2d, the only fault being that there were too many sorts of *Ixora*. Six varieties.—For these Mr. McIndoe was again 1st, staging similar kinds to those in his larger group. With two bridal bouquets Mr. Wright and Mr. Kylan were respectively 1st and 2d. *With two* Mr. Kylan, gr. to Mr. G. G. Peaches, had 1st, and Mr. G. G. Peaches, gr. to R. Dickinson, Esq., Durham, 2d. Stand of flowers.—1st, Mr. Baynes; 2d, Mr. Wright.

Messrs. Downie & Laird, Edinburgh, exhibited, as is their wont, a beautiful collection of *Fansies* and *Violas*, splendid flowers, combining good form and colour.

colours. In the group were several new ones, which received First-class Certificates: amongst these was *May Tree*, extra large, good substance, colour dark, purple ground, with a broad, bright yellow margin, a grand flower; *Ruby*, dark mulberry, lower petals edged with canary-yellow, upper petals bright ruby edged with white; *L. Dawson*, a fine flower of a deep claret colour, edged with white all round; also a new *Viola*, *Countess of Hopetoun*, a decided advance in colour, which is pure white, without the least streak or shade; *Viola Duchess of Albany*, violet-purple shading off to white in the outer petals; *Duke of Albany*, deep purple, lower petals shading to pale purplish-white in the top. From Mr. E. Thompson, a *Horwax*, exact, not for competition, a good collection of miscellaneous new and rare flowering and fine-leaved plants, including a number of *Orchids*, *Nepenthes*, *Sarracenias*, *Heaths*, *Palms*, *Ferns*, new *Crotons*, *Dracaenas*, and others of like character. Messrs. South, of Worcester, had a nice lot of cut herbaceous flowers, including the best varieties of *double Pyrethrum*, and some beautiful *Peonies*; in the herbaceous flowers was a beautiful bunch of *Cypripedium spectabile*, with unusually large blooms.

FRUIT was shown in considerable quantities. With ten dishes Mr. McIndoe took 1st, his best being a *Queen Pine*, *Stanwick Elong Nectarines*, and *Brown Turkey Figs*. Mr. Mann, gr. to Mrs. Hornsby, Grantham, was 2d, with amongst others, nice examples of *Royal Vinograd Grapes*, *May Duke Cherries*, and *Rivers' Proflic Plums*. In the class for six dishes the best fruit was shown, and the competition was better—Mr. McIndoe again taking 1st with *Black Hamburg* and *Muscot Grapes*, a *Pine*, *Barrington Peaches*, *Brown Turkey Figs*, and a *Melon*. Chief taulker, who was 2d, was James Veitch *Strawberries*, a *Golden Queen Melon*, *Black Hamburg*, and *Forster's Seedling Grapes* in nice order. Mr. Clayton, gr. to J. Fielden, Esq., Tadcaster, was 3d, his collection being little, if at all inferior to the last named; it contained *Westfield Court* and *Muscot* of *Alexandria Grapes*, the latter better finished than usually seen so early; *A. Bee Peaches*, and *Violette Hative Nectarines*, beautifully coloured. For four dishes Mr. Wallis, gr. to Sir H. M. Thompson, York, took the lead, showing, in a nice collection, a good dish of *Black Hamburg* and *Black Hambur Grapes*, Mr. Westcott, gr. to the Duke of Cleveland, Raby, 2d. In the class for Black Grapes there were ten exhibitors, collectively staging good fruit for the time of the year. 1st, Mr. Wallis, small bunches, well finished; 2d, Mr. Leadbetter, gr. to Admiral the Hon. O. Duncombe, who had, quartered, *Black Hamburg*, *Black Queen*; Mr. Faulkner, 2d, likewise showing the same excellent kind. *Scarlet-fleshed Melon*.—1st, Mr. McIndoe. *Green-fleshed*, ditto.—1st, Mr. Swanwick, staging *Best of All*. *Figs*.—1st, Mr. McIndoe, a good dish of *Brown Turkey*.

VEGETABLES.—For ten dishes Mr. McIndoe had 1st with a very good lot, in which was a beautiful dish of *Tomatoes*, and both varieties of *Telephone Peas*, in nice condition; 2d, Mr. G. G. Peaches, gr. to W. J. Cholmley, Esq., likewise a meritorious collection.

South Essex Floricultural.—The annual exhibition of this Society was held in the grounds of J. Gurney Barclay, Esq., Knotts Green, Leyton, on Wednesday, June 14. The exhibition was not quite so successful as last year, owing to the absence of a prominent exhibitor; but the quality of the exhibits was quite up to the average, and in the case of some things even superior to that in any previous season. Stove and greenhouse flowering plants were as usual a prominent feature, and Mr. Donald, gr. to J. G. Barclay, Esq., was awarded the 1st prize for eight, and also grand for six. He had a splendid *Adenanthe fragrans*; its beautiful rose-coloured flowers had a pleasing effect. *Ixora Fraseri* was also fine. *Boronia elatior*, in the class for six, showed its best. Mr. Douglas, gr. to E. Whitbourn, Esq., of Loxford Hall, Ilford, was 1st for the best single specimen with an immense well-flowered *Anthurium Schzerianum*. In the *Orchid* classes Mr. Douglas gained the 1st prize for eight, and the 2d for six. He staged a large specimen of *Dendrobium Dholistanum* with eighteen spikes. For four specimens Mr. Monk, gr. to W. Fowler, Esq., Walthamstow, gained the highest award; the highest place for a single specimen being occupied by Mr. Gilks, gr. to A. Brown, Esq., Highgate Hill, Walthamstow, with a really good *Lelia purpurata*, fine both in a plant and a variety. *Fine-foliage* plants always make a prominent feature at this exhibition, and Mr. Ward, who has charge of the arrangement of the tent, always places with these the most delicate groups with the most interesting plants. Mr. Douglas was in the highest place with six, *Cycas rotundifolia* being a handsome specimen, and *Kentia Carterburyana*, a handsome Palm. The same exhibitor was placed 1st for a single specimen with *Cycas rotundifolia*. Mr. Douglas was 1st for *Abutilons* in a large competition. There were also numerous sections of *Coleus*, but Mr. Monk's was by far the best. Mr. Donald, gr. to A. Brown, Esq., Highgate Hill, Walthamstow, was 1st for a single specimen with *Canary Bird*, *George Simpson*, *Mrs. G. Simpson*, *Aeol*, and *Firefly*, very fine. The same exhibitor had also a fine group of *Cockscomb*; for these and six *Gloxinia* Mr. Donald was 2d. Mr. Donald staged the finest *Ericas*, and large as well as finely flowered they were; *Candolleana* and *Farricena* were the best. Mr. Donald's *Fuchsias* were also better than usual; they were handsome well-furnished specimens,

clothed from base to summit with foliage and flowers. *Stage Pelargoniums* were not up to the usual point of excellence. Mr. Donald had the best—Mr. E. Crook, gr. to E. Baxter, Esq., Leytonstone, securing the highest awards for single and double *Stage Pelargoniums*. Numerous groups of plants were exhibited in the large tent, of various degrees of excellence. *Ferns* in the large tent formed a very prominent feature. Messrs. Douglas, Gilks, and Monk taking 1st prizes. In another tent were the table decorations, cut flowers, fruits, and vegetables, and it was well filled with very creditable productions, the stands of flowers, bouquets, &c., being numerous and attractive. The 1st class is for groups of three wases; the 1st prize in this class was awarded to Mrs. Douglas, of Ilford, with the usual *March stands*; the centre one was much admired, the base formed of *Roses*, white *Pelargoniums*, and *Anthurium*; the centre with *Saxifragas* and *Cattleya Mossie*; the trumpet being filled with single *Anthurium*, and a few *Orchid* sprays, with *Stipa pinnata* and *Maidenhair Ferns*. Mr. Gilks gained the 1st prize for a single stand in the gardeners' classes, while the amateurs were well represented by Mr. Sutton Abbot, Wansford, who was 1st for a very nicely arranged design; and also Mr. Mclland, Chelmsford Road, Woodford, who was in the 1st position with three very well furnished and tastefully arranged vases, *Corniflowers* and *Lilies* being very pretty. There was no much fruit exhibited, but some of it was very fine—the *Black Grapes* especially so. Mr. Bagg, gr. to G. Bervick, Esq., Walthamstow, had the best *Black Grapes*, and Mr. Douglas the best white. *Strawberries* were well shown by Mr. Donald, and *Cherries* by Mr. Douglas. Mr. Donald also exhibited an excellent *Fineapple*. Baskets of vegetables were very numerous, and filled with quality very good. Mr. Donald had the best collection of eight varieties, and Mr. Mallett the best collection of six.

The Weather.

- June 15.—A dull, overcast morning, fine bright afternoon. Thunder heard at 3.20 P.M. Fine night.
- 16.—A very fine bright day. Fine cloudy night.
- 17.—A very fine bright day. Fine cloudy night.
- 18.—Rain in early morning; sun shone for a little time after 10 A.M., rain from 1 P.M. till 2 P.M. Cloudy, cold night.
- 19.—A dull, overcast morning; fine afternoon, but mostly overcast. Fine, calm, cloudy night.
- 20.—A dull, overcast day and night.
- 21.—A dull, but, on the whole, a fine day; gleams of sunshine at times, a very thin rain falling at midnight. Cloudy night.

LONDON: Atmospheric Pressure.—During the week ending June 17, the reading of the barometer at the level of the sea increased from 29.86 inches at the beginning of the week to 30.04 inches by 9 A.M. on the 11th, decreased to 29.82 inches by 9 A.M. on the 12th, increased to 29.98 inches by 3 P.M. on the 13th, decreased to 29.81 inches by midnight on the 14th, increased to 30.25 inches by midnight on the 16th, and was 29.94 inches by the end of the week.

The mean reading for the week at the level of the sea was 29.98 inches, being 0.26 inch higher than last week, and 0.01 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 69°, on the 17th. On the 13th the highest temperature reached was 55°. The mean of the seven high day temperatures was 61°.

The lowest temperature in the shade in the week was 42° 5' on the 13th; on the 14th the lowest temperature was 50°. The mean of the seven lowest temperatures was 46° 2'.

The greatest range of temperature in one day was 22°, on the 17th; the smallest was 10° 5', on the 11th. The mean of the seven daily ranges was 14° 8'.

Surplus Stock.
WILLIAM BADMAN can still supply as under in established plants turned out of 60's.
PELARGONIUMS Vesuvius, Jean Sisley, Madame Vaucher, White; Master Christine, Pink; Lucius, and others, at 8s. per 100. 75s. per 1000; Broeze McAlon, Black Douglas, Crar, and others, 15s. per 100; Crystal Palace Gem, 10s. per 100; Happy Thought and Silver-edged, 10s. per 100; Mrs. Pollock and Lass of Gowrie, spring-struck, 15s. per 100.
DAHLIAS, best Show and Fancy sorts, 15s. per 100. **LOEBLIAS**, in best sorts, 8s. per 100.

(REGISTERED)
Hydro-Carbon Oil as Insecticides and Washes for Plants and Animals.

SOLUBLE
FIR TREE OIL INSECTICIDE.
Bottles, 1s. 6d., 2s. 6d., 4s. 6d., and 9s. 6d.;
Gallons, 12s. 6d.; Cases, 11s. per gallon.
 It destroys all insect pests on plants and fruit trees, whether at the roots or on the foliage. It destroys all parasites and fungoids which infest animals and human beings. It is free from poison, very clean and pleasant in the using. It is the cheapest insecticide ever introduced.
Testimonial.
Wiltshire Gardens, February 15, 1882.
 Mr. HUGHES, Sir, — Please send me one gallon Fir Tree Oil. I have again tried the above, and believe it to be what has been said of it. My previous dissatisfaction with it was on account of its not being soiled sufficiently. — Yours,
JAS. TISSINGTON.
 From all Seedsmen and Chemists. Manufactured by **E. GRIFFITHS HUGHES**, Operative Chemist, Victoria Street, Manchester.

GISHURST COMPOUND. — Used by many of the leading Nurseries, at once a Gallon Fir Tree Oil, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 oz. to the gallon of soft water, and of from 4 to 16 oz. as a winter dressing for Vines and Fruit Trees. Has obtained many preparations intended to supersede it. In Boxes, 1s. 6d., 2s. 6d., 4s. 6d., and 9s. 6d.
AMERICAN BLIGHT ON APPLE TREES CURED by rubbing a wet hard Painter's brush on Gishurst Compound, and working the lather into the infected part.
GISHURSTINE keeps feet dry, softens hard boots, preserves leather, takes a polish. In boxes, 6d. and 1s. each. — Wholesale by **PRICE'S PATENT CANDLE COMPANY** (Limited), Retail by Seedsmen and Chemists. Complaints are made of difficulty in getting Gishurstine. Some leading Nurserymen have put it on their lists, others are requested to do so.

J. B. BROWN & CO., 90, CANNON STREET, LONDON, E.C.

Oil Paint No Longer Necessary.

HILL and SMITH'S BLACK VARNISH, for Preserving ironing Wood or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the nobility and gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 12 gallons each, at 15. 6d. per gallon, at the Manufactory, or in 10. 6d. per gallon carriage paid to any Station in the Kingdom.

UNIMPEACHED TESTIMONIAL.

"*Proceedings Park, June 21, 1876.*—Sir:—I have this day forwarded from Glenelg to your address a Black Varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pinnerfield Park, Chesham.—I am, Sir, yours respectfully, Wm. Ainslie."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which it is not genuine.

Large Illustrations of FENCING, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH'S, Briefley Hill Ironworks, Staffordshire; 125, Queen Victoria Street, London, E.C. 7; and 130, Buchanan Street, Glasgow.

ADIE'S PATENT LAWN EDGER.

This Machine constantly employed
will pay itself in two days. Dr. Hogg, in the
Journal of Horticulture, says—"This Edger Clipper
we have tried, and know not only to admire
most its simplicity or efficiency." Mr. Moore,
in the *Florist*, says—"This new ma-
chine does its work rapidly and
admirably, the grass being cut
with precision, and," he further
adds, "the use of it will, we have
no doubt, become general." Price 3s.

"Gather Honey from Your Flowers."
NEIGHBOUR'S Celebrated **BEEHIVES**
for taking Honey without the destruction of the Bees.
PHILADELPHIA EXHIBITION, 1876.
PARIS EXHIBITION, 1878.

Three Silver Prize Medals awarded to Geo. Neighbour & Sons,
Also the Prize Silver Cup at the Caledonian Apian Society's
Show at Edinburgh, 1877 (in connection with the Highland and
Agricultural Society's Annual Exhibition), for the largest and
best display of Bees, Bee-Hives, and Bee Apparatus.

NEIGHBOUR'S
IMPROVED
COTTAGE BEE-HIVE

—Solely introduced by
Geo. Neighbour & Sons,
working three bell-glasses,
and strongly made
of straw; it has three
windows in the lower Hive.

This Hive will be found to
possess many practical ad-
vantages, and is more easy
of management than any
other Beehive that has
been introduced.

Price, complete **£1 15 0**
Stand for ditto **0 10 0**

PHILADELPHIA BAR-FRAME HIVE, from which the
Combs can be removed at side opening whilst supers are on.
This Hive affords remarkable facilities for manipulation, because
the frames can also be taken out from top as with other Frame

Hives, and at the same time afford great opportunity for full
inspection, having glass in three sides closed with shutters.
Price, complete, with Cover and Stand, 4s.; also Bar-
Frame Hives, of most approved construction, at 7s. 6d., 12s. 6d.,
to 15s. each.
An **ITALIAN ALP QUEEN**, with full directions for
uniting to Black Stocks, at current prices.
LIGURIAN and ENGLISH BEES.—Stocks and Swarms
may be had as heretofore.
"THE APIARY." BY ALFRED NEIGHBOUR. 5s.
postage 3d.
A newly-arranged Catalogue of other Improved Hives and
Appliances, with Drawings and Prices, sent on receipt of two
stamps.
GEO. NEIGHBOUR AND SONS, 127, High Holborn, W.C.,
and 149, Regent Street, London, W.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which will save us many weary doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up, until strong enough to resist every tendency to disease. Hundreds of subtle insidies are floating around us ready to attack wherever there is a weak point, and may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame." — *Civil Service Gazette.*

JAMES EMPPS and CO., HOMOEOPATHIC CHEMISTS, London. Makers of Epps's Chocolate. Essence for Afternoon use.

HOLLOWAY'S OINTMENT and PILLS. — "Though it is so valuable in the climate of changing temperature, to prevent ill-health, its frequency may be much mitigated by the early adoption of remedial measures. When it is necessary, Cough, Throat Breathing, and the attending slight Fever, are treated of the Throat by the use of the Ointment, or Chest. Holloway's Ointment should be rubbed upon these parts without delay, and his Pills taken in appropriate doses, to promote its curative action. Some Throats can resist these remedies. Printed directions enveloped every box of Holloway's medicaments, which are suited to all ages and conditions, and to every ordinary disease to which humanity is liable."

HORTICULTURAL BUILDINGS
OF EVERY DESCRIPTION
ERECTED and HEATED.

STAR BOILER.

Cheapest Boiler in the Trade.

KEITH'S PATENT HOT-WATER BOILERS.

Can be heightened or lowered, or made to suit any requirements. They stand complete in themselves, and require no building work, being wholly water-jacketed and thus entirely free from risk by fire. They can be had all sizes, to heat from, say, a few feet, up to 8000 feet of 4-inch pipe each; are now in all parts of the world, and are unrivalled as being the best, most powerful, and most economical Hot-water Boilers in use.

Specimen Extracts from Testimonials,

From W. MORGAN ROBBINS, Esq., *Architect, Uffculme, September 9, 1881.*
"I am delighted with your Boiler; it answers admirably, and the directors are satisfied that it is one of the best £15 worth ever put in the hotel."
From J. C. CHALMERS, *Gardens of James Mudie, Esq., Glasgow Ferry, September 15, 1882.*
"Your Boiler beats all my expectations, at present one fire serves for twelve hours, and keeps up a good, steady heat."
From ISAAC HOLDEN, Esq., *Oakworth House, Keighley, Yorkshire, June 10, 1881.*
"Your Boilers are the best we have tried." (Note: one of these Boilers heats nearly 8000 feet of 4-inch pipe.)
From WM. FRASER, *Kippen Gardens, Dunning, Perthshire, December 6, 1881.*
"I consider your Boiler most efficient; as for economy, it is the acme of perfection."
From Rev. JAMES CARDWELL, *Military Academy, Highlands, Jersey, December 31, 1881.*
"Nothing could be better than the Boiler you sent me; it burns all sorts of rubbish, and gives an excellent heat."
From ARTHUR BOOTY, Esq., *Rose Villa Nurseries, High Harrogate, March 27, 1882.*
"Your Boiler has exceeded all my expectations; it will pay for itself as a fuel saver in a short time. It heats 200 feet of 4-inch pipe."
Keith's Treatise on "Heating by Artificial Means," post-free for twelve stamps.
JAMES KEITH,
GAS, HYDRAULIC AND HOT-WATER ENGINEER,
Edinburgh and Abroath.
Just awarded "Three First-class Medals" and "Honourable Mention" by the Philosophical Society of Glasgow.
